

# Maximizing Electrical Output at ComEd Nuclear Stations

by David J. Miller  
Kevin Rumbaugh  
James Rafferty  
and Gary Loeb

# ComEd Background

- ComEd operates 5 Nuclear Stations in Northern Illinois
- All five stations contain dual units
  - Braidwood - Dual 1188 MW Units
  - Byron - Dual 1183 MW Units
  - Dresden - Dual 832 MW Units
  - LaSalle - Dual 1140 MW Units
  - Quad Cities - Dual 819 MW Units
- All units will be uprated 5 to 10%
- All units will apply for NRC license renewal

# PI System Configuration

- Each site has local PI 3.2 server on NT
- 5K to 10K tags per server
- 5 years of on-line storage space available
- Main Plant Process Computers:
  - Honeywell 4010/4500
  - Re-hosted Westinghouse 2500 systems

# How PI is utilized

- PI does not provide any “control”
- Most controls in a nuclear plant are analog
- Most of the protection circuitry is analog
  - hard wired, relays, bi-stable switches, etc.
- Very few digital systems actually provide “control”
- Plant Process Computers monitor plant systems
- PI provides
  - multi-user real time monitoring
  - fast retrieval of historical data

# Getting Data to the End User

- Using existing company LAN/WAN for company wide connectivity
- Using standard company WIN95 desktop PCs for ProcessBook/Datalink
- 130 ProcessBook/Datalink licenses distributed throughout nuclear division
- Engineers at each site can access all sites' data

DEH System

Chemistry Data

# Uses of PI

- Executive Overview of nuclear unit status
- Standard ProcessBooks for plant systems
- Electronic Operator Rounds
- Thermal Performance Optimization

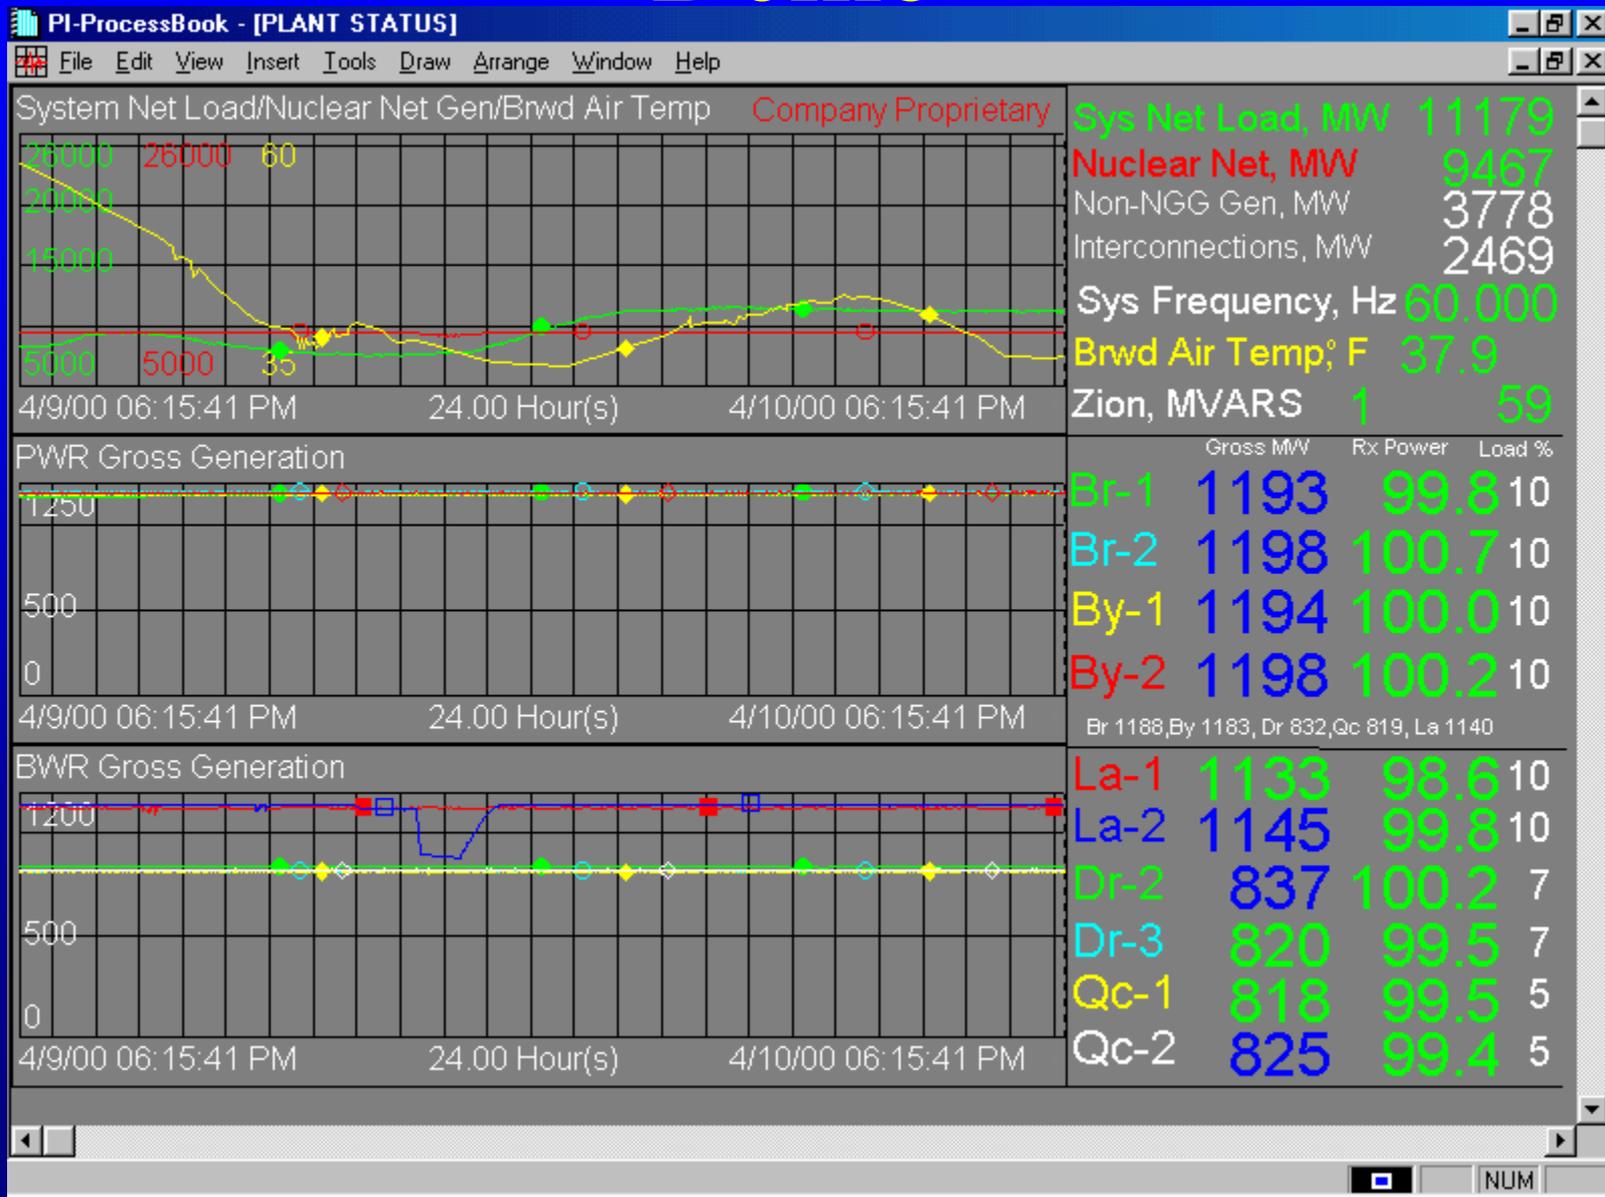

# Executive Overview Display

- Central server collects data via PI to PI from all nuclear site servers
- Data consists of:
  - electrical generation (MWs)
  - and reactor power (%)
- ComEd electrical grid system information obtained from T&D PI system
- PI Performance equations calculate total nuclear contribution to system net load

# Executive Overview Display (cont.)

- Provides near real-time view of all ComEd owned generation
- All nuclear personnel can access PI
- Lets each site see how they contribute to the overall power generation and load profile
- Large display in Corporate Operations Center used for quick reference
- CEO has ProcessBook and the display on his laptop

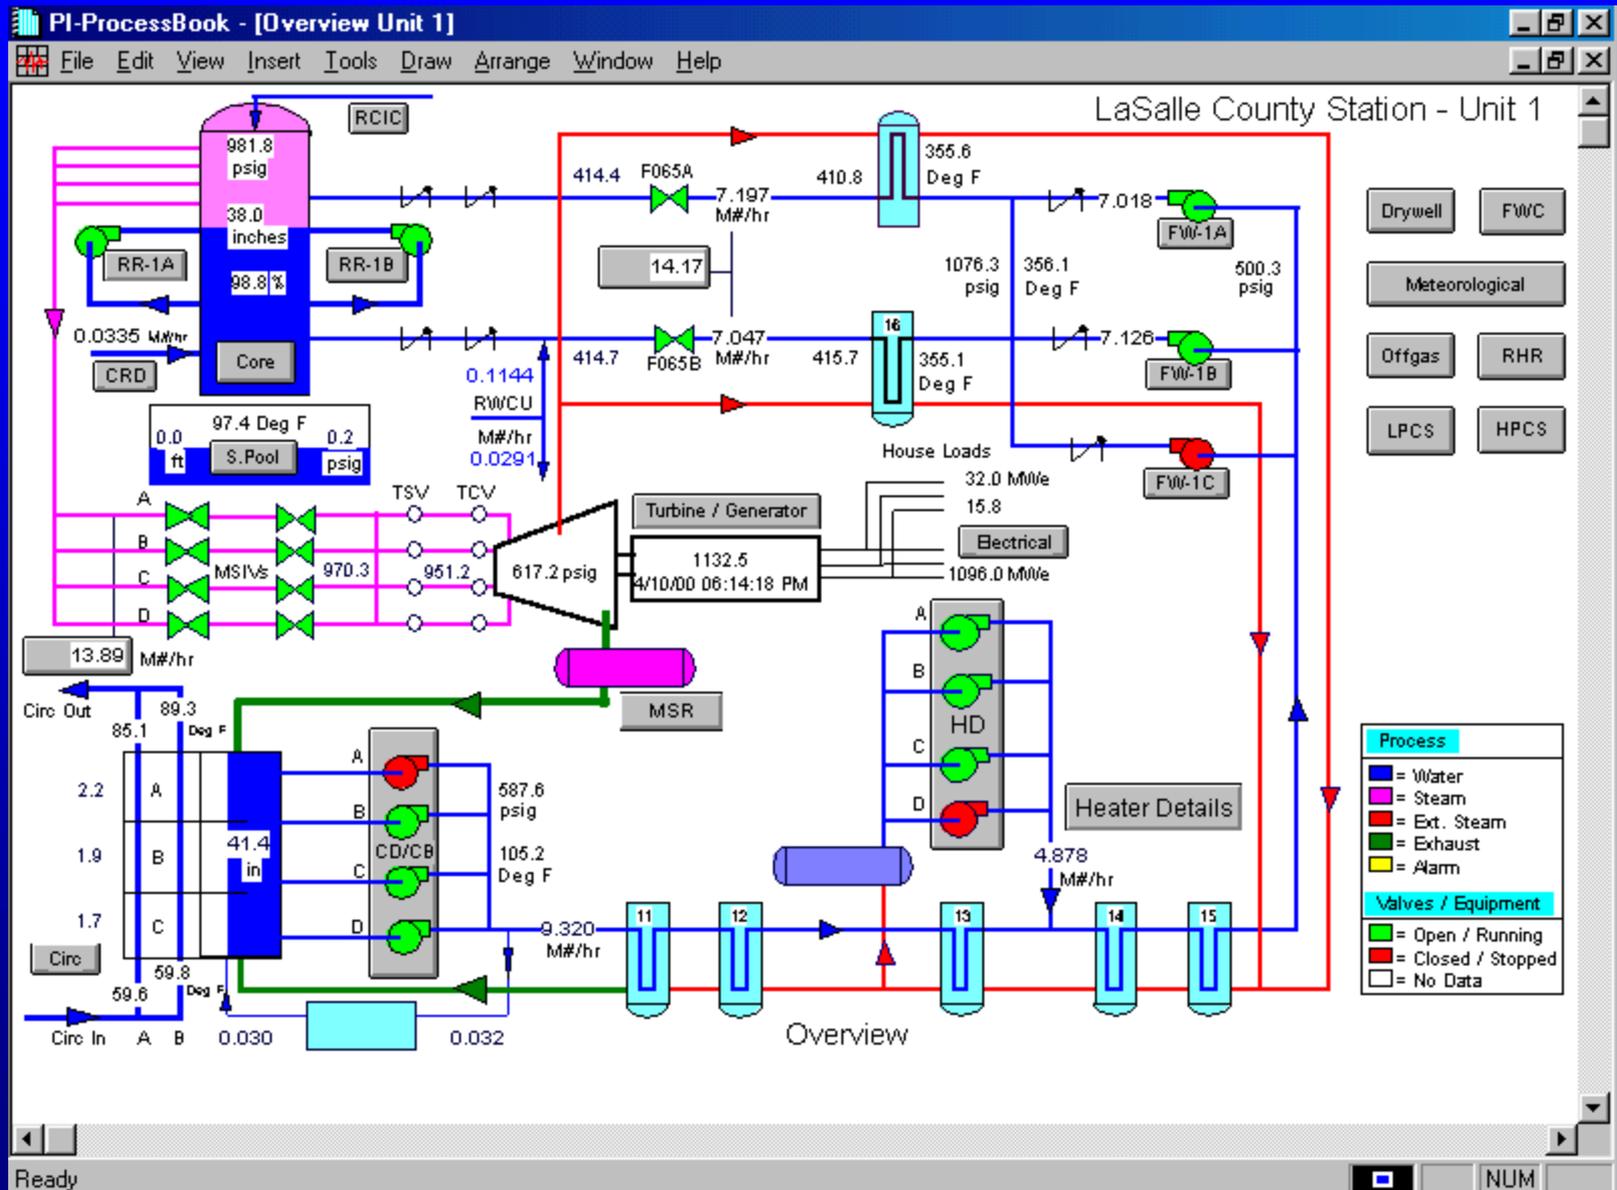

# Executive Overview Display Demo

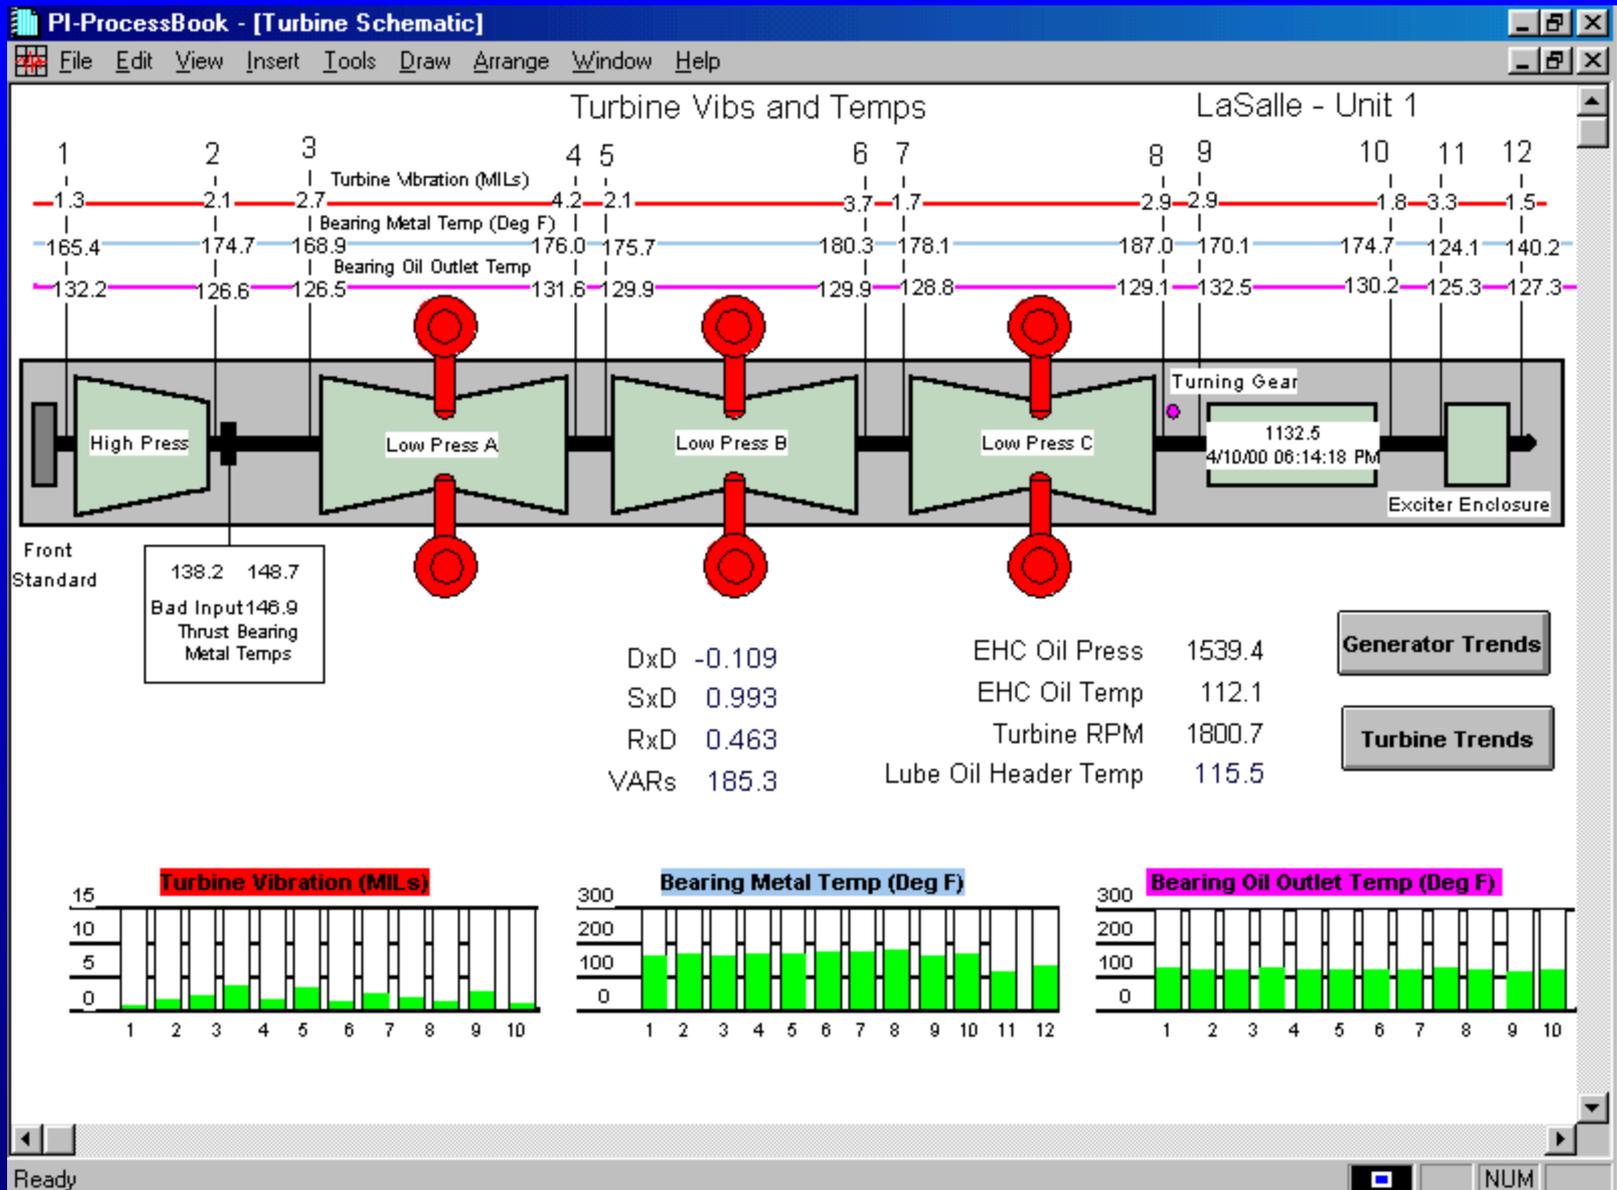

# Standardized Plant ProcessBooks

- Developed standard processbooks for each unit
- Created using common active symbols and color schemes
- Consist of a simplified overview of the entire steam cycle
- Each system has its own tab (30 to 50 tabs)
- Created buttons to jump from tab to tab
- Buttons used to drill down into data
  - provide next layer of data
  - displays trends

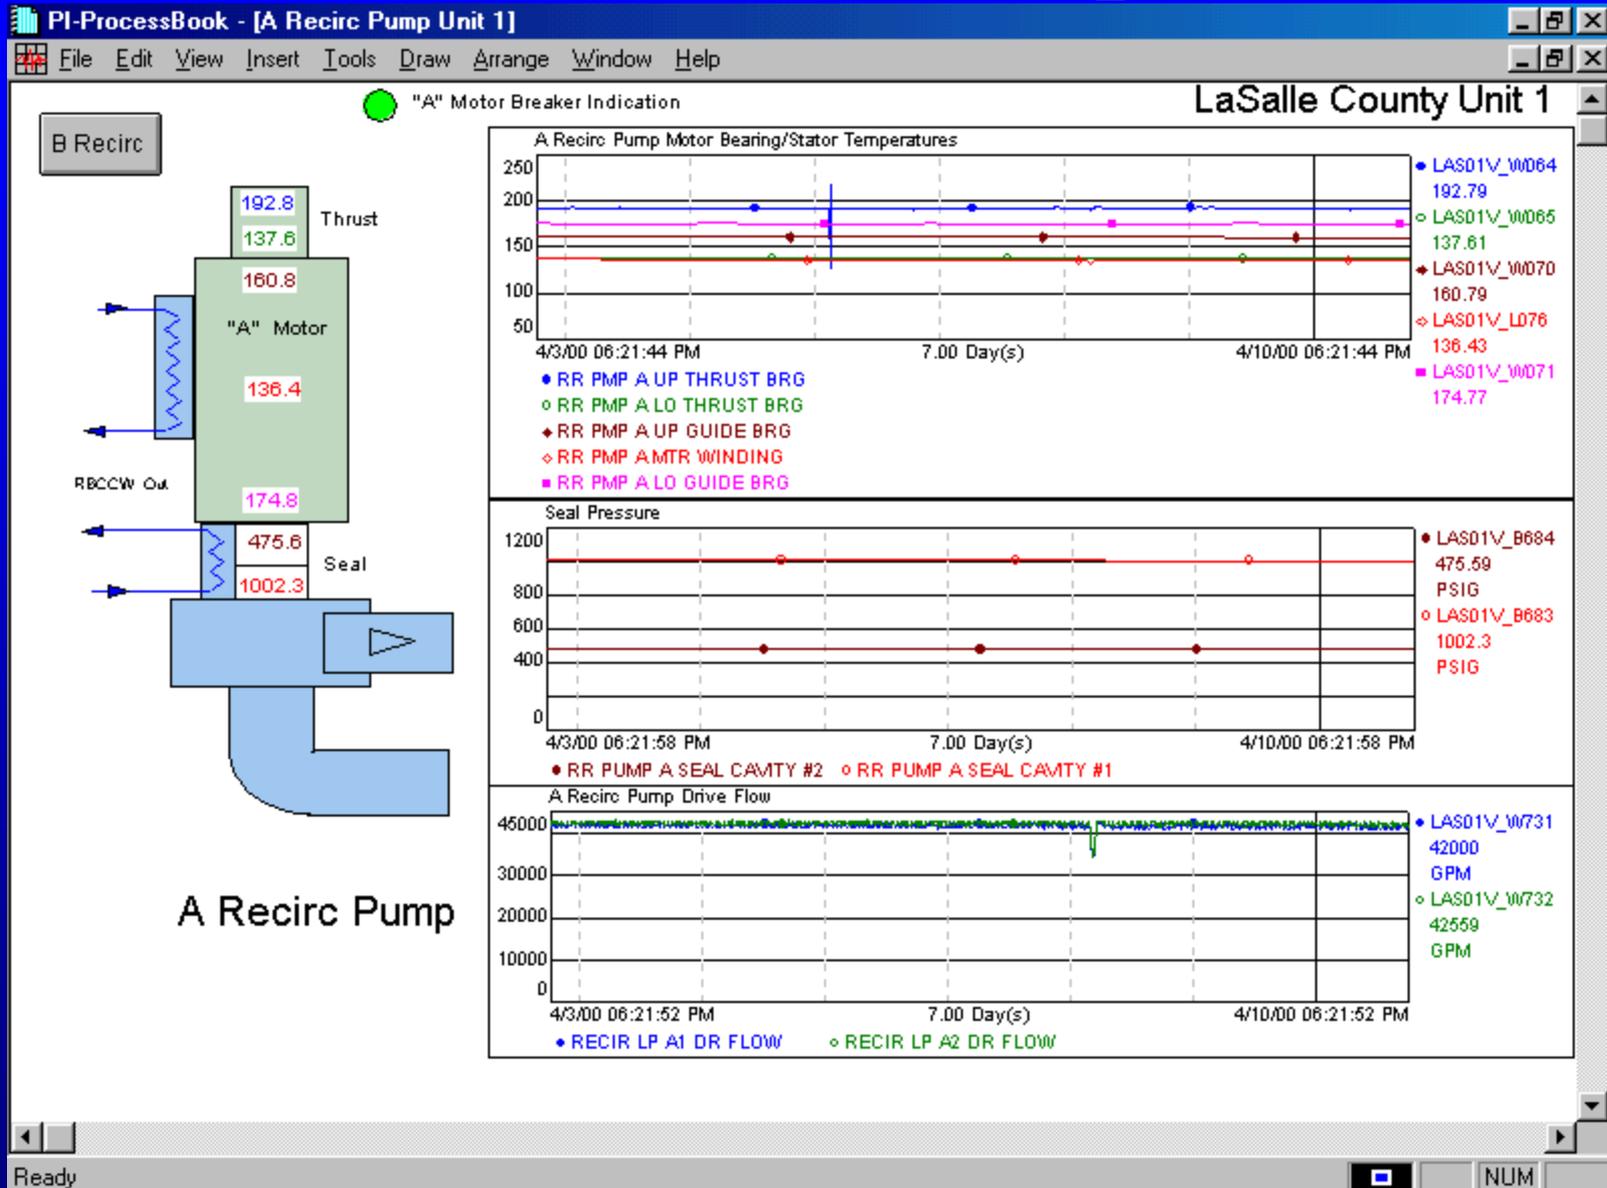

# LaSalle Overview Demo

# LaSalle Turbine/Generator Demo

# LaSalle Recirc Pump Demo

# Electronic Operator Rounds

- Operators use the NOMS software for collection and storage of data
- Data collected using hand-held Husky Data Logger
- Data is fed to an Oracle Database
- Interface Program NOMS 2 PI
  - Downloads data once per evening
  - Allows engineers to display rounds data along with process computer data

# Thermal Performance Optimization

- Using DataLink to download plant data to Excel
- Common Excel spreadsheet developed for each unit
  - Specific unit selected by clicking on one button
  - Calorimetric calculations or heat balance done on live data
  - Calculation performed on demand or runs continuously

# Thermal Performance Optimization

(cont.)

- Simplified for Operators
  - Displays Reactor, Turbine and Condenser parameters
  - Compares actual values to theoretical best
  - Shows off-normal values
  - Gives Operators potential equipment problems to investigate and correct
  - Calorimetric calculations are transparent to Operators

## BRAIDWOOD UNIT 1 TURBINE CYCLE THERMAL PERFORMANCE DATA

Data taken: 10-Apr-00 18:25:10

Turbine		
Gross Output:	<b>1190.9</b>	MWe
Corrected Gross Output:	<b>1195.3</b>	MWe
Expected Output:	<b>1199.1</b>	MWe
Base Comparison Output:	<b>1174.8</b>	MWe

Condenser		
CW Inlet Temp.	<b>57.3</b>	deg F
Base Comparison CWT:	<b>92.0</b>	deg F
Back Pressure:	<b>2.03*</b>	in Hg
Corr. for CW Temp.:	<b>24.3</b>	MWe
CW Pumps On:	<b>2</b>	pumps

Reactor		
Core Power:	<b>3398.5</b>	MWt
Core Power:	<b>99.63</b>	%
Rated Power:	<b>3411.0</b>	MWt

### Key Items That Effect MW Output

**Less than Full Reactor Power**

- Final Feedwater Temperature Error/Problem
- Feedwater Heater OOS
- CW Pump Off (above 60 deg F)
- Turbine Driven Feed Pump Off
- Low Steam Generator Blowdown Flow

Possible deviation areas are highlighted **Red**.

Start Continuous Data Update

Press [Esc], then select "End" to stop continuous data update.

### MWe Gross vs. CW Temperature

CWT (deg F)	Gross MWe (Upper Curve)	Gross MWe (Lower Curve)
45	1195	1190
57.3	1198	1190.9
65	1205	1195
75	1200	1190
85	1185	1175
95	1165	1160

## BRAIDWOOD UNIT 2 TURBINE CYCLE THERMAL PERFORMANCE DATA

Data taken: 10-Apr-00 18:28:03

Turbine		
Gross Output:	<b>1198.7</b>	MWe
Corrected Gross Output:	<b>1199.0</b>	MWe
Expected Output:	<b>1200.1</b>	MWe
Base Comparison Output:	<b>1174.8</b>	MWe

Condenser		
CW Inlet Temp.	<b>56.4</b>	deg F
Base Comparison CWT:	<b>92.0</b>	deg F
Back Pressure:	<b>1.60*</b>	in Hg
Corr. for CW Temp.:	<b>25.3</b>	MWe
CW Pumps On:	<b>3</b>	pumps

Reactor		
Core Power:	<b>3410.0</b>	MWt
Core Power:	<b>99.97</b>	%
Rated Power:	<b>3411.0</b>	MWt

### Key Items That Effect MW Output

- Less than Full Reactor Power
- Final Feedwater Temperature Error/Problem
- Feedwater Heater OOS
- CW Pump Off (above 60 deg F)
- Turbine Driven Feed Pump Off
- Low Steam Generator Blowdown Flow

Possible deviation areas are highlighted **Red**.

Ready NUM

# Looking towards the Future

- ComEd merging with PECO
- Merger expected to occur on Aug. 1, 2000
- New company called Exelon
- Nuclear Stations will be grouped by region
- Midwest Regional Operating Group
  - will include existing ComEd Nuclear fleet
  - plus Clinton Nuclear Station

# Looking towards the Future

(cont.)

- Clinton Station owned by Amergen
  - Amergen owned by PECO and British Nuclear
- Clinton located in Central Illinois
- Clinton is a single unit station
- Clinton will need a PI Server to communicate with the Midwest ROG

# Mid-Atlantic ROG

- Mid-Atlantic Regional Operating Group
  - Limerick
  - Peach Bottom
  - Three Mile Island
  - Oyster Creek
- Establishing a Regional Operations Center
- Mid-Atlantic ROG installing PI to monitor units
  - 100 tag systems per station initially
  - Executive Display will be similar to one developed for ComEd Group

# Additional Uses of PI System

- PI Historian primary repository for all time-series historical plant data
- Use PI as the backbone for System Engineer Workstation
- Chemistry Parameter Displays
- Integrate Plant Process Computer and PI; use PI as PPC's real-time database
- Increase scan rate for data
- Troubleshooting and event analysis
- Auto e-mail/pager notification when a system fails
- Take over functions of GSEP system

# GSEP Point History (Old Historian vs PI)

- 1 minute resolution
- 50 MB per day
- Only 100 out of 1200 turbine points
- Each system has custom interface
- 5 second resolution
- 10 MB per day
- All 1200 points are available
- Common interface, namely Process Book

# Conclusion

- End Users have to be given some examples of how PI can be used
- After that, allow creativity and innovation to flourish
