

# PI System Case Studies in the Cement Industry

Presented by **Rainer Muhm**  
**OSIsoft**

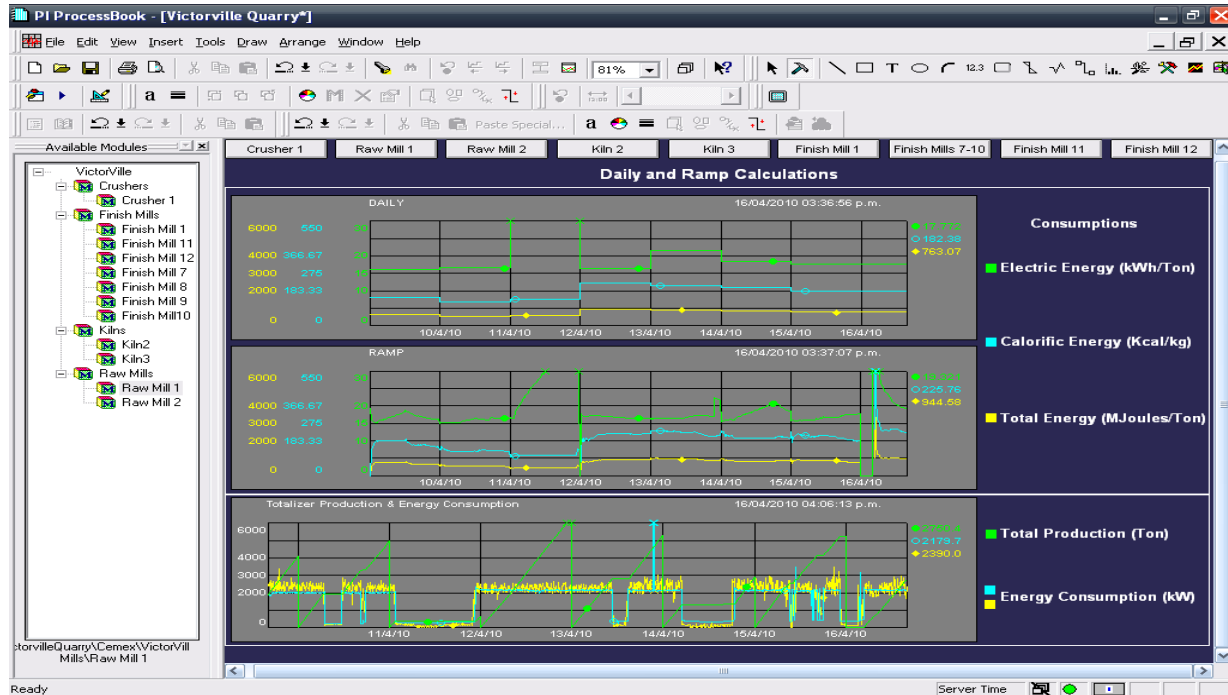

# ENERGY

## Solution Architecture Diagram

# ENERGY

## PB Displays Examples

# ENERGY

## Results & Benefits

- Enhanced online detailed view of energy consumption
- Reduction in the use of fossil fuels
- Cost reductions in the use of energy (cost estimation being evaluated)
- Project applicable for carbon credits
- Easy replication in other facilities

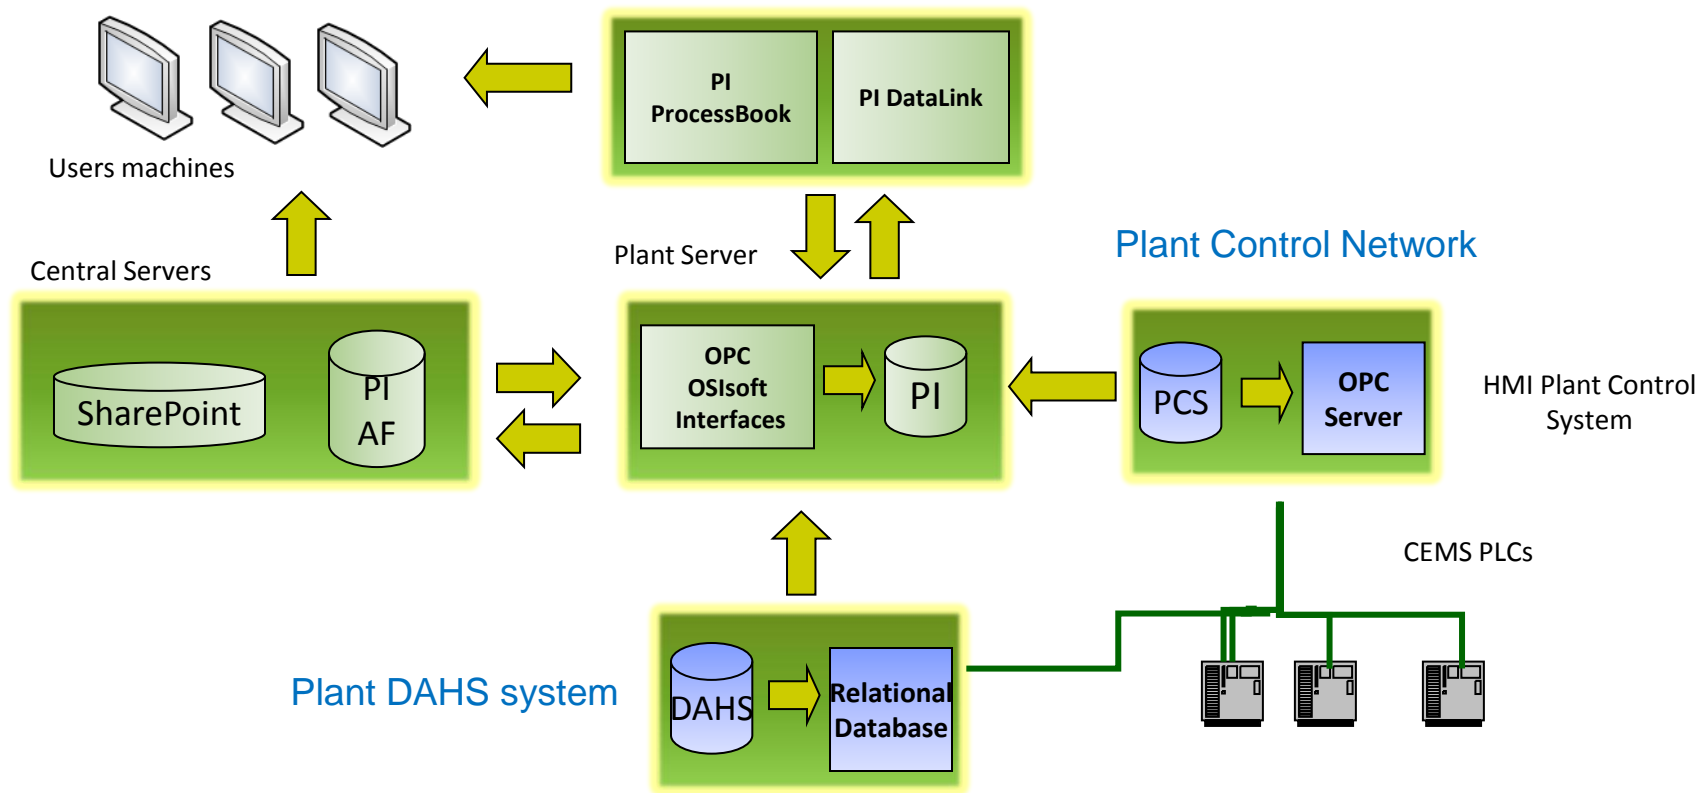

# Emissions

As part of the company's cost reduction strategy, it decided to replace the current Emissions Monitoring System with the actual Plant Information Management System (PIMS) to reduce the TCO. PIMS is based in PI Server, PI AF, PI WebParts, PI DataLink and PI SDK.

The company has decided to decommission the usage of an existing environmental reporting system for keeping in compliance with Federal and Local environmental agencies.

The company needed to pay an annual fee for being able to use the current environmental reporting system, this annual fee is paid by each cement plant that uses this reporting system.

# Emissions

# Emissions

## Results

- Data is **available** from a common and easy to use platform, and most importantly the data is hosted inside the company's network.
- All needed information for environmental reporting is **consolidated** on the PI server, and this helps the integration and easy access to data in only one place.
- All environmental information is **scalable** to different levels at the organization from Excel reports using **PI DataLink** to internal websites using **PI WebParts**.
- We have more **reliable** ways to present just one version of the truth by using the different tools from the PI platform.

# Emissions

## Tangible benefits

- CEMEX will be **saving 20K USD** on annual fees, per each location where the former environmental reporting system is being used, that means around **220K USD** in total savings (per year) for the 11 cement plants in the USA.
- Therefore, we can reduce the **TCO** in the Environmental department for having/maintaining an in-house reporting system.

# Emissions

## Intangible benefits

- We are **extending the usage** of our PI platform to other departments, other than Cement Operations, by stimulating the usage of the PI platform in the company, and taking advantage from our EA with **OSIsoft**.
- We have started a way to **standardize** the development of reports needed at our cement plants.
- End users are discovering different ways where PI can help to **add value** in different areas of the company.

# QUALITY

## Quality

Integrate Quality Lab Equipment to PIMS and develop new functionality in order to replace actual Institutional Quality Systems.

- Analyze and evaluate alternatives to integrate Quality information on a single infrastructure and replacing Quality Legacy applications functionalities such as:
  - ✓ Data extraction (interface)
  - ✓ Manual Input
  - ✓ Plant Configuration
  - ✓ Reports
  - ✓ Quality Assurance Margin indicator
  - ✓ Interfaces to another systems

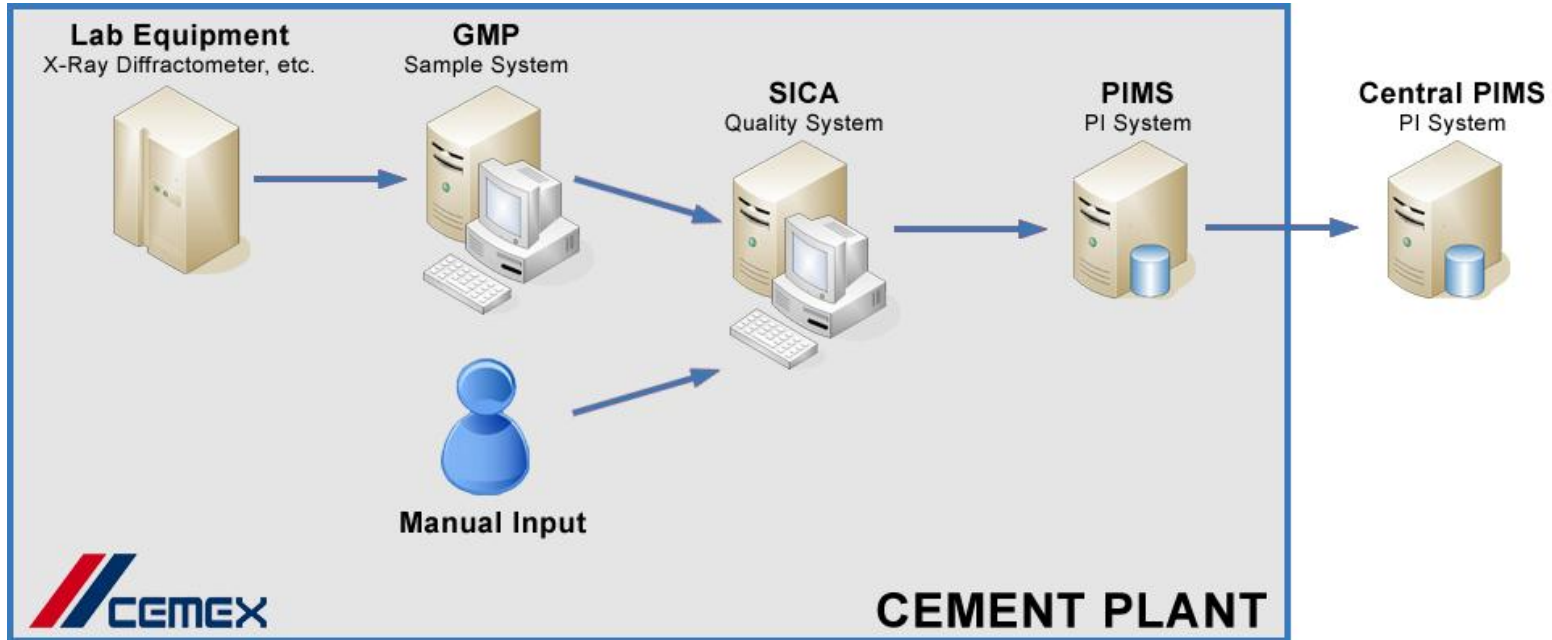

Replacing these functionalities allows CEMEX to reduce **TCO** costs, by eliminating actual Quality Systems expenses like:

- ✓ Application Support
- ✓ Hardware Maintenance
- ✓ Software Upgrades

## Lab Equipment Interface Configuration

The screenshot shows a software window titled "MONTERREY CEMEX New sample configuration". It contains several sections for configuring a sample:

- Sample configuration:** Includes fields for Sample (FOURLY RAW MEAL), Description, Lab equipment (X-RAY CUBIX), Equipment (Molino de Materias Primas S E), Material (Limestone), and Inspection point (Feed). A "Continue" button is at the bottom right.
- Define sample type:** Includes a "Type" dropdown (set to "Delimited") and a table for defining sample structure.
- Define variable type:** Includes a "Type" dropdown (set to "Fixed") and a "Configure variables" button.
- Variable detail:** Includes an "Add variables" button and two tables for variable parameters.

**Table 1: Sample Structure**

Line	Element	Del. char
1	2	

**Table 2: Variable Parameters**

Variables	Variable parameters				Value parameters	
	ID	Line	Position	Length	Position	Length
Tricalcium Alminate Content ASTM			2	20	2	2

**Table 3: PMS-QM Variables**

Description	Code	Variable parameters				Value parameters	
		ID	Line	Position	Length	Position	Length
Dicalcium Silicate Content ASTM	A2S	1	1	2	20	2	2

Buttons: "Remove variable", "Save", "Exit".

# QUALITY

## Results using PI System features

- Single Platform for Quality and Production data
- Standardization
- Real-time Quality KPI's
- Faster data gathering process
- Enhanced data security
- Easy corporate consolidation
- Cross business visibility

# QUALITY

## Intangible Benefits

### Results using PI System features

- Keep quality practices standardized
- Business unit benchmarking
- Production and quality data correlation
- Integrate X-ray equipment from different vendors
- Eliminate risk of technology obsolescence
- Easy integration with company ERP (SAP)

# QUALITY

## Results Phase 1 - Deployment (14 plants in Mexico)

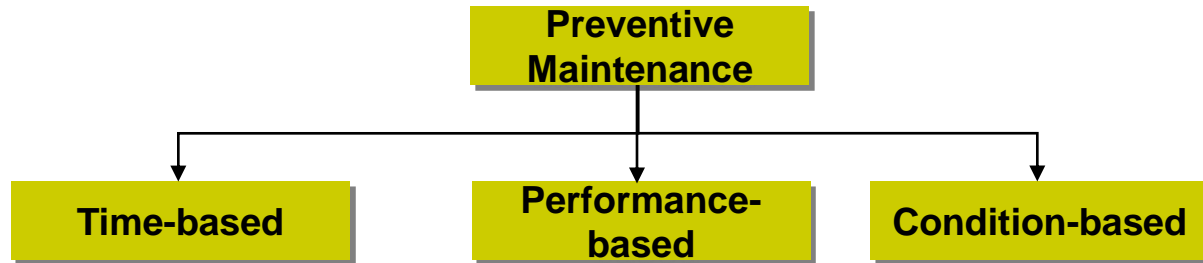

### Tangible Benefits

- Reduce TCO of previous in-house system by USD \$ 800 k/year approx.
- Calculated ROI is 6 months
- No extra cost for OSIsoft licenses, all are included in the Enterprise Agreement

# MAINTENANCE

## Maintenance

Improve assets utilization and reduce maintenance costs by providing indicators and trigger tags for preventive maintenance based on performance and operation conditions. Integrate process control data from the main equipment to calculate tags that trigger automatically work orders for preventive maintenance through the ERP.

**IMPLEMENTED USING PI Notifications**

# MAINTENANCE

## Benefits

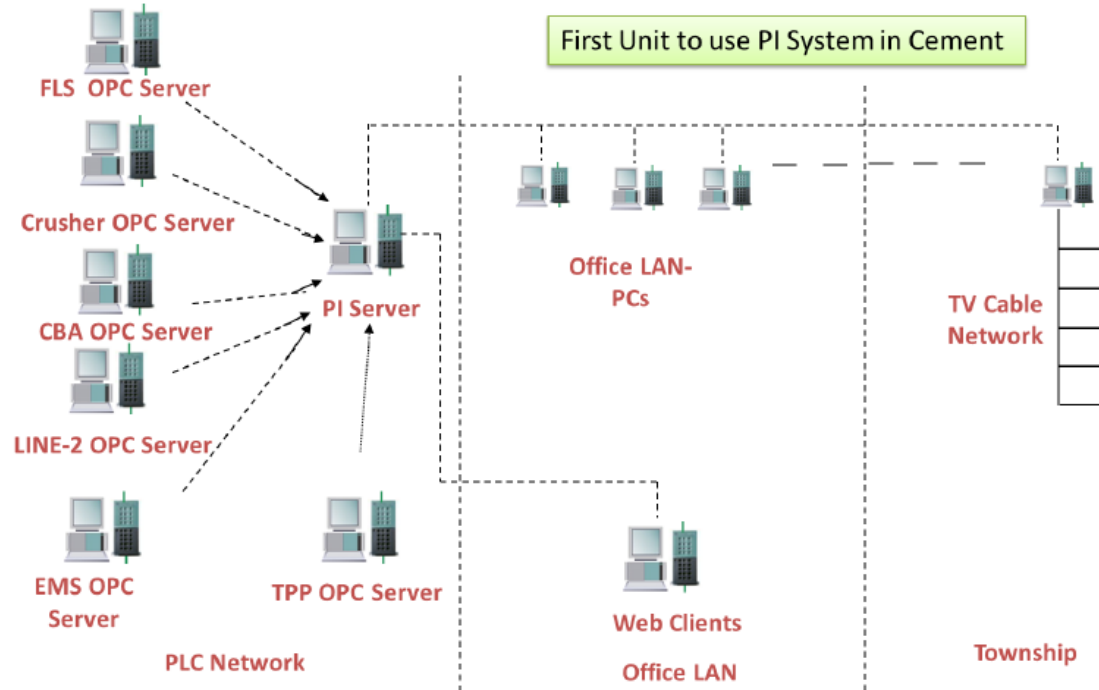

- Reduced maintenance engineers effort and time to manual input equipment run hours at ERP.
- Empowered preventive maintenance routines based on automatic run hours input.
- Improved resources costs increasing preventive maintenance instead of corrective maintenance (decreasing spare parts requirements and increasing maintenance engineers available time for analysis).

# PI Data to ERP (SAP)

## Benefits

- Automated and validated data transfer to the ERP.
- Real-Time operational indicator interaction between PI and SAP
- Ability to have tighter inventory control and automated work orders
- Up-to-date data for enterprise wide decisions

# PI System Architecture at UltraTech Cement Ltd. Aditya Cement Works Shambhupura

# Improvement Cases at Aditya Cement

# Results and Performance Data

KILN I Ever Highest Clinker  
TPD 5079 in July 10, Previous best  
was 5018 in the month  
July '07(with 100% Pet Coke).

KILN I Lowest Power  
Consumption 24.20 Kwh/Mat,  
Previous best was 27.06  
Kwh/Mat in the month  
July '07(with 100% Pet Coke).

Aditya Cement

KILN II Highest TPD 9657 with  
>10000 TPD for 17 days. Jan11  
(OEM Guarantee 8000 TPD )

RAW MILL-II Ever Highest  
Monthly TPH: 581.8, Previous  
best was 572.83 TPH n the  
month June '10

RAW MILL-II Ever Lowest  
Power Consumption  
19.56 Kwh/T of Material
