# Business Challenge – In Line Quality

# Business Challenge – In Line Quality

- Finished rolls become lapped or “stuck” at the slitting and winding process
- Rolls are scrapped at a significant cost
- 3 winders (24/7)

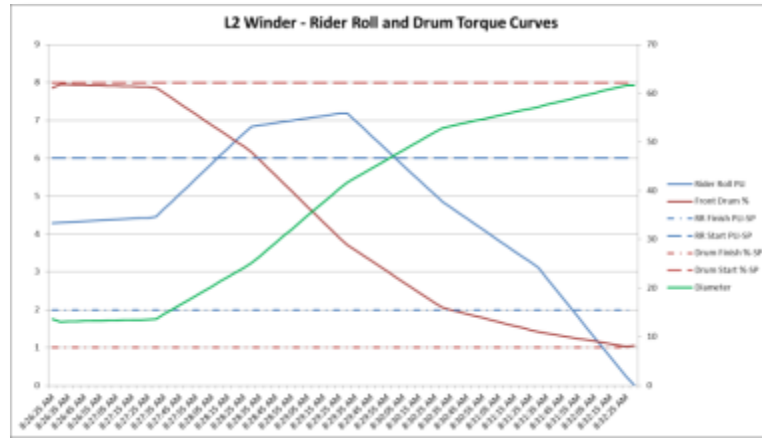

# Business Challenge – In Line Quality

- One particular piece of equipment consistently produced “stuck” rolls
  - Produced on all types of product grades and widths
  - Significantly higher amounts produced on drive side of equipment

# Leveraging Applications – Data Analysis to Drive Solution

- Collected Data
  - PI ProcessBook
  - PI DataLink
  - Descriptive “Stuck Roll” Form

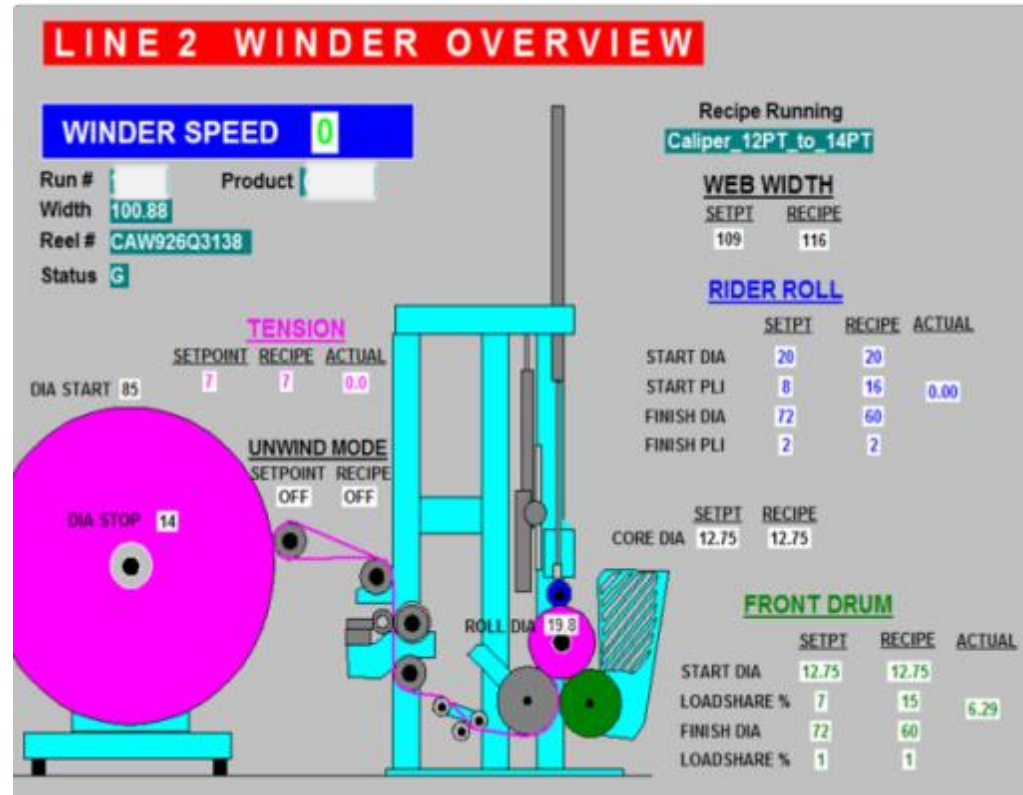

STUCK ROLL DATA COLLECTION				LINE 1 2 3	
Date	Time	Grade	# of stuck rolls	Where did rolls start?	Why did rolls start?
11/19	6:30 AM		2		DRIVE SIDE CHAINED MOVED
11/10	5:00 AM		4		LEFT TAIL END AN UNDOOR ALLOWED DRUM
11/11	2:00 AM		3		DRUM TOP LOOSE
11/13	10:00 AM		2		TECH SHAWNT IN TOLLIV

# Implementation Details

- Collected real time data when both off quality and good quality products were produced.
- Six Sigma data analysis and defined problem solving techniques determined:
  - Process variation between recipe set points and process running set points were common issue when off quality product was produced.
  - Operator knowledge of set point variation was minimal

# How Individual Product Capabilities Solved Your Business Challenge

- Established process set points
  - Three basic groups (recipes) of products
- Created PI ProcessBook screen to monitor recipe set points vs running parameters

# Basic Training

- Operators trained on basics of “TNT” for winding
  - Tension
  - Nip
  - Torque
- Trained on recipes
  - How to recall
  - How to check recipes vs running parameters

PAPERBOARD <sup>1</sup>	TENSION LEVEL	RIDER ROLL START DIA PLI (NIP LOADING)
8 Point	4 PLI	8-12 PLI

# PI ProcessBook – Monitoring Real Time

- PI ProcessBook screen created to monitor recipe points vs running parameters.
- Screen made available to operators, supervisors, and managers on local intranet
- Duplicate PICOresight screen available via remote login

# Notifications

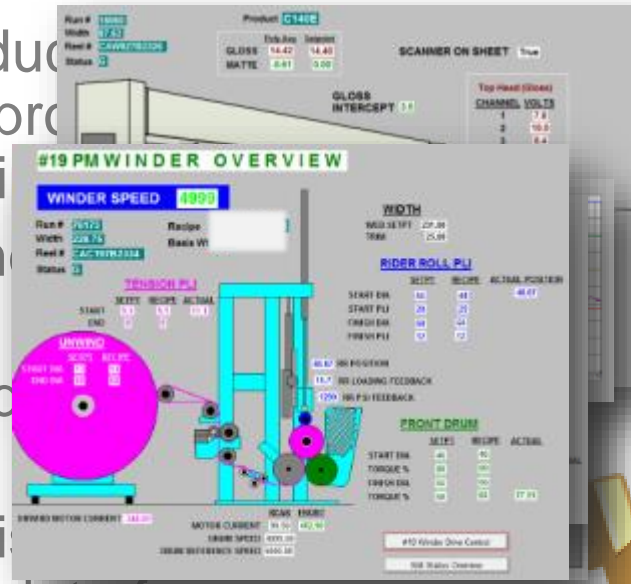

- Notifications created to alert when winder is running above or below setpoint
- Different notifications for 3 main parameters “**TNT**”
  - Tension
  - Nip
  - Torque

# Results Obtained and Business Impact

- Greater than 60% reduction in amount of off quality product produced on this equipment
- Maintained improvement for 12 months
- Leveraged to other equipment with similar results
- Operator and Supervisor can monitor process with data for immediate feedback to positively impact results

# Leveraging PI Data for In-Line Quality Improvement

## COMPANY and GOAL

Evergreen Packing produces fiber based packaging and needed to significantly reduce in-line quality issues at the final step in the extrusion coating process.

## CHALLENGE

Determining machine recipe settings vs running parameters when off quality products were produced.

- Data not often captured when off quality product produced
- Operators not fully trained to understand and interact with machine parameters.

## SOLUTION

Real time data captured using PI ProcessBook and PI DataLink.

- PI ProcessBook screen setup to monitor recipe settings vs running parameters
- PI DataLink tables established to review good vs off quality parameters
- Notifications implemented to alert when recipe set points do not match running parameters.

## RESULTS

Saved ~\$180,000 in one year by reducing off quality product produced on target equipment by 60%

- Operators understand winder parameter settings better and training program updated
- Sustainable results with real time monitoring and notifications
- Leveraging lessons learned to other similar equipment

# Conclusion

- Real Time and Historical Data is key to root cause analysis
- Operator Engagement with data will yield faster results
- Analysis has to be done on good production as well as off quality production.
- Immediate feedback with PI Notifications will result in increased in-line quality.
