

Case Study: Smart sewer analytics set to prevent spills, save environment

Matt Jordan, Manager Network Asset Performance @ TasWater

Andrew May, Senior Consultant @ Nukon (OSIsoft partner)

Conference Theme & Keywords

Smart sewer analytics pilot

TasWater commenced operations on 1 July, 2013 and was formed through the amalgamation of the three Tasmanian Water and Sewerage Corporations.

TasWater's vision is to be a trusted and respected provider of essential services that is making a positive difference to Tasmania.

CHALLENGE

How to receive advanced warning of and prevent potential sewage spills given limited field sensor data and varying operating conditions?

- Midway Point Tasmania
- Sensitive shellfish growing area
- Proactive monitoring for “difficult” to monitor assets and scenarios

SOLUTION

The PI Data Infrastructure, Asset Framework, Asset Analytics, Event Frames, PI Notifications, Seeq and real-time insights developed by Nukon.

- AF Asset hierarchy synchronized with ClearSCADA system using Nukon CS2PI Integration toolkit.
- AF Analytics for SPS Operation (pump starts and run times)
- Seeq Analytics for machine learning and PI Event Frame generation
- PI Notifications for OCC alerts

RESULTS

New detection methods better than current methods. Proactive field call out to other abnormal behaviors ahead of spill conditions.

- 13 hours ahead of current methods
- Successfully detected multiple anomalies with the network
- Future expansion to other failure modes and regions
- Rapid adoption

About TasWater

TasWater is Tasmania's primary water and sewerage service provider.

Created from three regional water and sewerage companies in 2013.

Who is Nukon?

- We began in 2013 and have grown rapidly from a 1 person company to our current team of 26 staff covering Australia and NZ. Nukon was acquired by SAGE Group in 2016. This group includes Nukon, SAGE Automation and NSAG.
- Key Customers
 - Coles
 - Murray Goulburn Co-Operative
 - Melbourne Airport
 - Fonterra
 - Treasury Wine Estates
 - TasWater
 - City West Water
 - South East Water
 - George Weston Foods
 - Simplot
 - GrainCorp
 - Chemring
 - CCA

NUKON

What we do

Digital Transformation

Some Stats

- Nukon SPS Monitoring Solution
- Seeq Workbench
- Nukon ClearSCADA to PI Configuration Management Tool
- OSIsoft PI Data Infrastructure
- Schneider Electric ClearSCADA Systems

Spills from the Sewerage Pipe Network

- Spills are an unavoidable reality of managing a sewerage network
- TasWater has approximately 2,000 sewer mains breaks and spills per year – 43 breaks / 100km sewer main
- Predominantly, these are ‘run to fail’ or ‘prevent fail’ assets
- High critical mains the strategy is ‘avoid fail’
- Proactive and Reactive Maintenance Practices
- Relining / Renewal – Only when cost effective

Goulbourn Valley Water

Spills from the Sewerage Pipe Network

- Maintenance Strategies are generally only effective on some types of blockages
- Sewerage system managers are always looking for ways to identify blockages as soon as possible to the event occurring, minimising or even preventing the consequences being realised

Blockage Causes

Midway Point Sewerage System

- 1 Sewage Treatment Plant
- 7 Sewage Pump Station
- 27 km of gravity sewer mains
- 1200 customer connections
- Surrounded by sensitive receiving waters

The Challenge - Sewage Spills to Sensitive Waters

Pitt Water

- Largest oyster lease area in Tasmania
- 14 hectares of inter-tidal leases

Rae Allen

asioysters.com.au

Ramsar Wetland

- **Internationally important wetland** - registered on a list of the Convention on Wetlands (Ramsar, Iran 1971)
- Australian Government passed the ***Environment Protection and Biodiversity Conservation Act 1999*** (EPBC).

Sewer Spills to Sensitive Waters

Sewage spill woe hitting oysters

Sewage spill hits oyster harvest

ALEX LUTTRELL

A SEWAGE spill at Pittwater over the weekend could impact some oyster farms, with one grower concerned the incident will affect his Christmas sales.

TasWater has alerted the Environment Protection Authority that the weekend deluge caused a release of sewage into Pittwater.

Mercury Newspaper 05/12/2017

HELEN KEMPTON

AN OYSTER farmer hit by a raw sewage leak says he will be unable to harvest up to 30,000 dozen oysters he had planned to sell in the lead-up to Christmas.

Heavy and unexpected rainfall on Friday caused a TasWater pump station to overflow and leak raw sewage at Pittwater.

Testing will have to be done before harvesting can recommence.

"The oysters are currently in their reproductive period and it will probably be four to eight months before they recover," Mr Poke said.

He said oyster growers could have a case for compensation from TasWater for the loss of earnings.

Sewage spill major blow for Pittwater oyster growers

A SEWAGE spill at Pittwater over the weekend could impact on some oyster farms, with one grower concerned the incident will impact on his Christmas sales.

<http://www.news.com.au/national/tasmania/sewage-spill-major-blow-for-pittwater-oyster-growers/news-story/df1233bc0582276bf1646fbde2fcb4ed>

How the Project Evolved

Blockage occurred 24 August 2017, spilling approximately 6,000 L into Pittwater

Problem: When a sewer main blocks and ultimately spills, the first notification TasWater has is from a member of the public hours and sometimes days after it first spills.

Question: What processes and monitoring techniques could we implement to detect sewer main failures as soon as practicable after the blockage has occurred, minimising the impact or preventing a spill occurring.

The Challenge

- Limited visibility into upstream and downstream network segments
- Notifications of blockages are 'reactive'
- Practically impossible (cost prohibitive) to instrument the entire network
- How to gain better visibility, without large capital investment?
- Existing monitoring at Sewage Pumping Stations via SCADA
Can this be utilised to infer an upstream blockage?

Project Value Drivers

TasWater's Vision: be a trusted and respected provider of essential services that is **making a positive difference to Tasmania**

- Community Safety
- Environmental Impact
- Impact on Local Economy
- Reputational Damage;
TasWater and Tasmania's 'Clean Green' image
- Incident management

Approach

- Highly Collaborative
- Agile
- Make the best possible use of existing telemetry
- Augment time-series data with data science

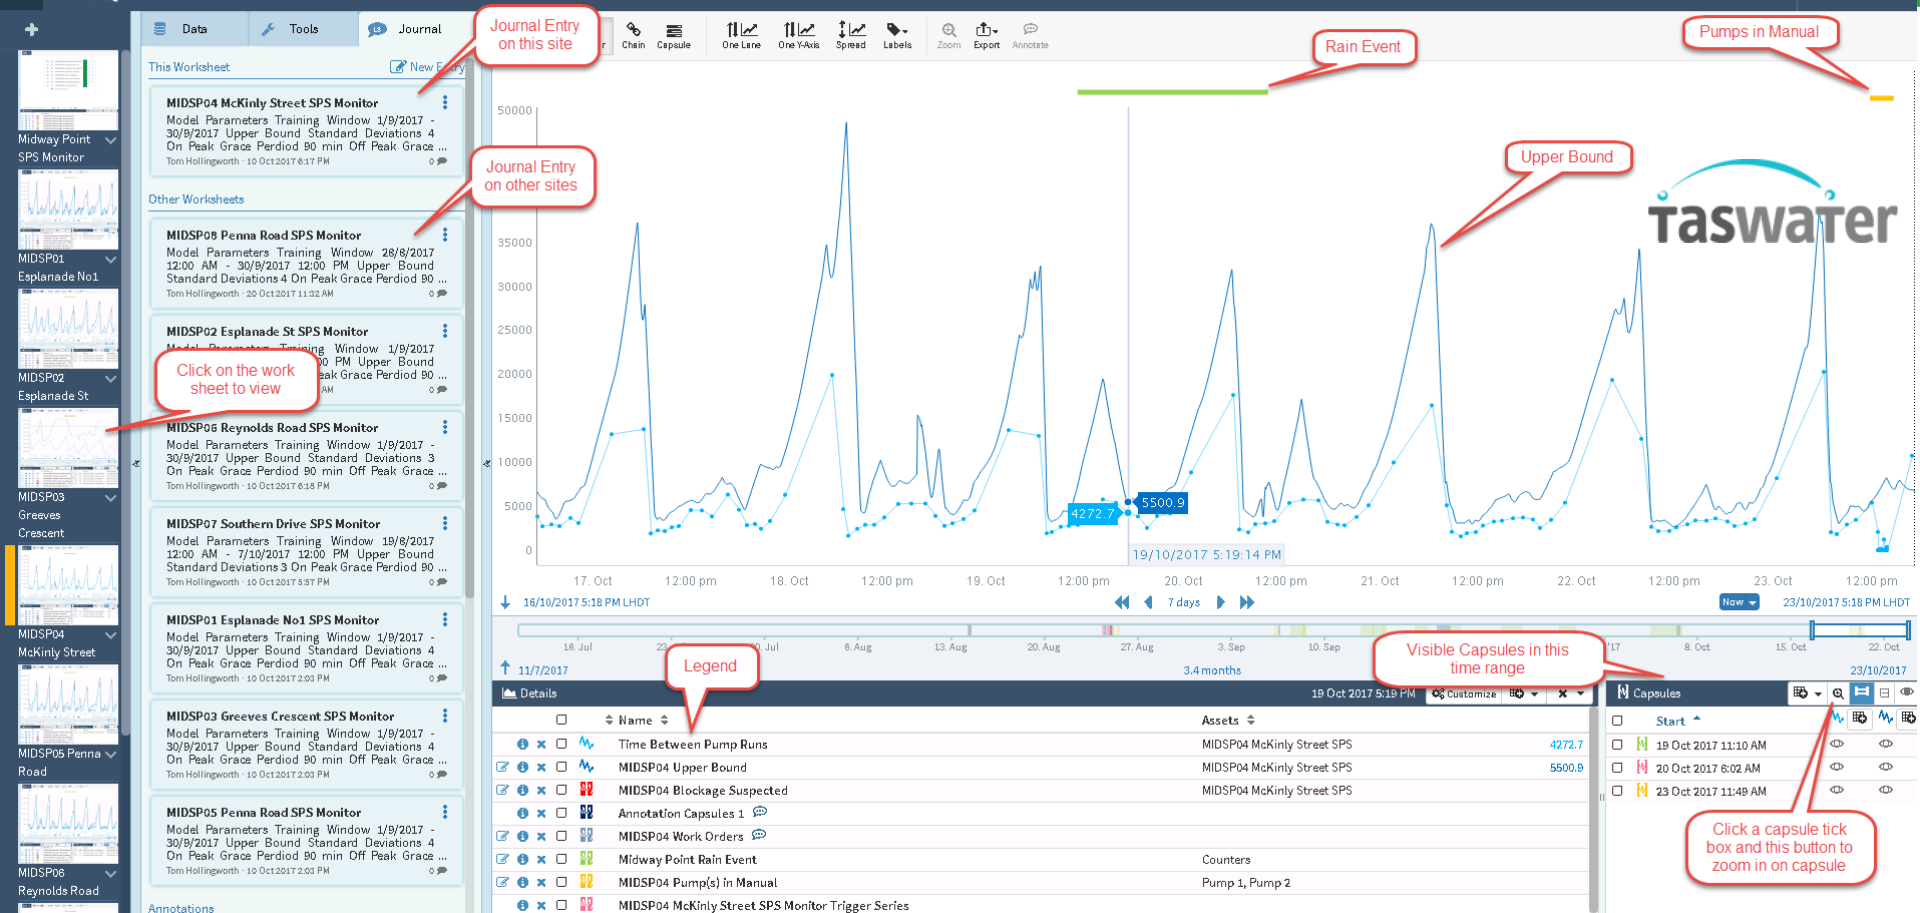

Benefits

TasWater realised these benefits:

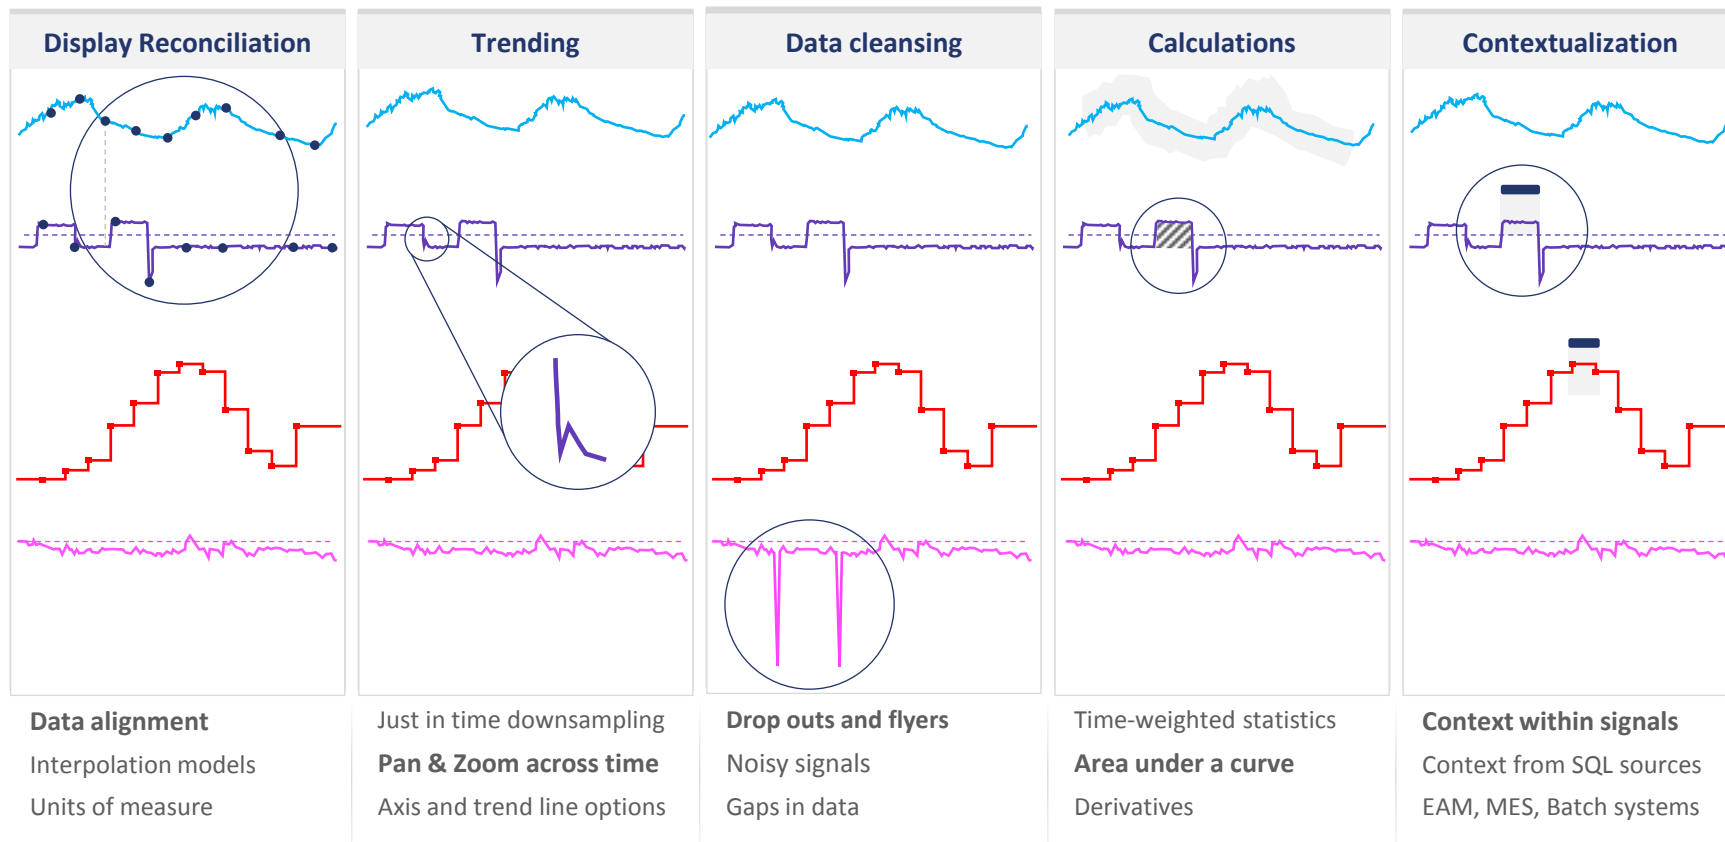

- Fast deployment & low cost of implementation
- Helps to protect the environment by reducing the number of significant incidents through early detection
- Improved insights into network and asset behaviour through event correlation
- Sophisticated analytical toolset which can be used for historical and real-time process data analytics
- Does not require additional monitoring at sites (deferred capital investment)
- Increases responsiveness to 'abnormal' operating conditions
- Active alerts for 'out-of-bounds' conditions, configurable based on unique behaviour of the asset

Capsules?... What the hell are capsules?

Process Data Challenges

Time Series Data

Time

Continuous analog signals (time, value)

Temperature

Years of history, **thousands** of sensors

Asset Operation

But lacking **context** (what was going on?)

Condition Definition

“**Conditions**” define when a state is true, and each instance of the condition is called a **capsule**

State

New Capsule

Weekly with Peak / Off-Peak Grace Windows

Starting Point

Aim

Determine if creating an upper bound from a weekly reference profile with different grace windows for peak/off peak can detect a blockage sooner without false positives of the blockage that occurred on 24th August 2017.

Description

Add 'Time Between Pump Events' and create capsules for each week. Create an upper limit a number of standard deviations from the process value. Create Peak and Off-Peak capsules. Create boundary searches for on/off peak. Combine capsules into a single capsule series for readability.

Detail

A training window of September 2017 was used. Through an iterative approach a standard deviation of 4 was identified for the upper bound. Peak times were defined as the period 11.5 hours from 8:30 am every day. For peak times a grace window of 1.5 hours was identified. For Off-Peak times a grace window of 5 hours was identified.

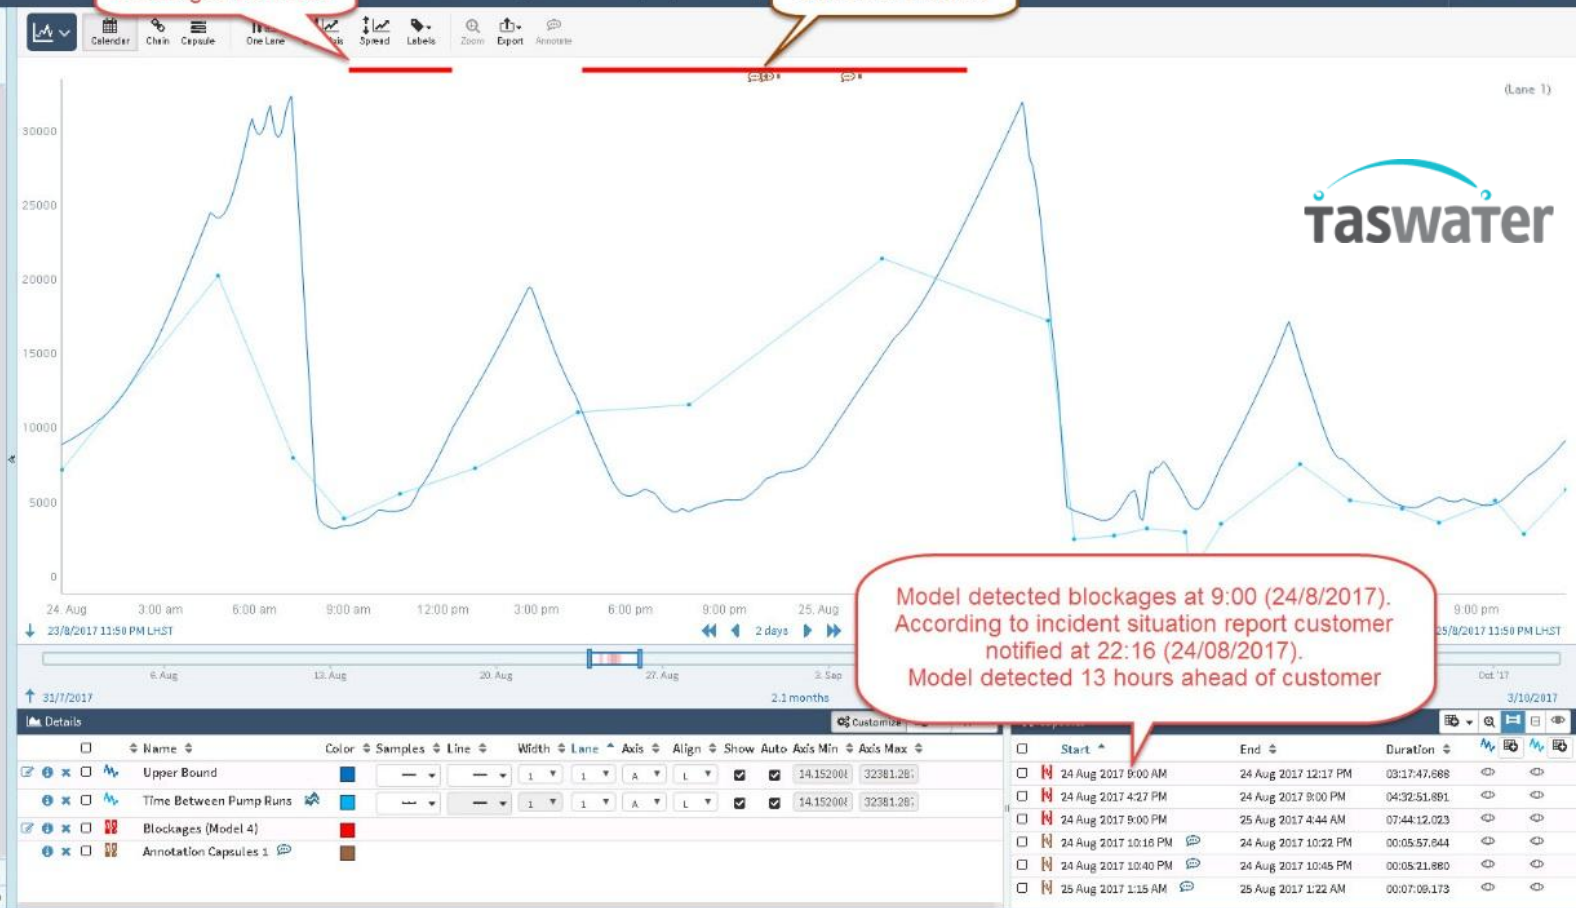

Results

This model detects the blockage well in advance of the previous models at 8:00am, approximately 13 hours before the customer informed of the event. This model also picks up no false positives.

Comments

Write-back Event Frames & Notifications

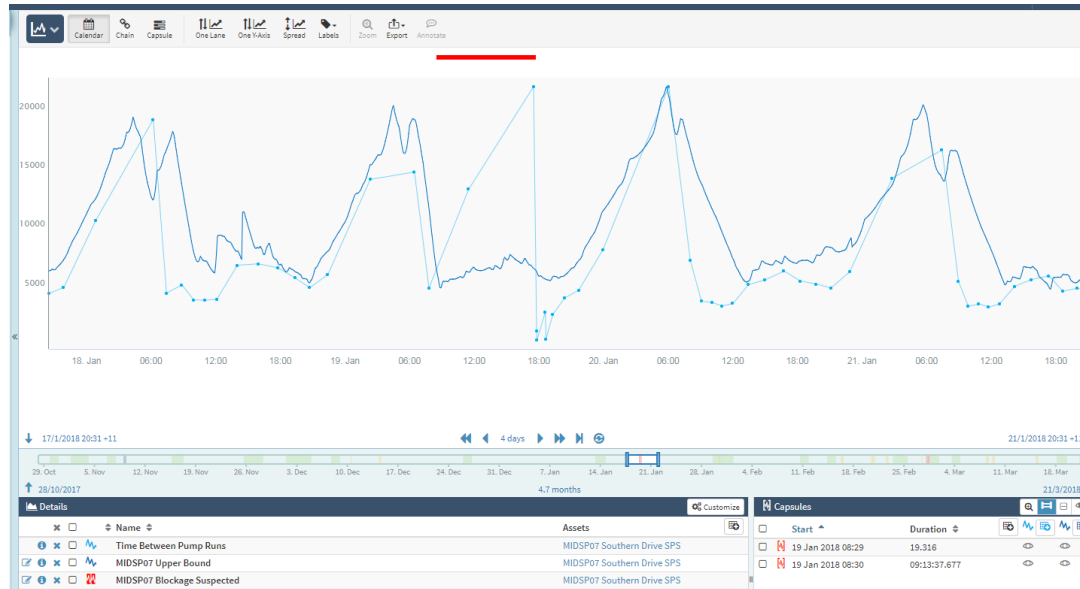

Case Study: Smart sewer analytics set to prevent spills, save environment

- Video (3 mins)

Current Application

- Yet to capture a blockage event – no dry weather blockages to date
- Successfully detected unusual flows

- Work Order: New SPS Softstarter
- Date of Work: 19/01/2018
- Pumps disabled during works

Outcomes

The new system will be trialled the over 12 months and will be initially constrained to the Midway Point sites to allow for model tuning.

- Solution has already detected abnormal behaviour
- Successful adoption by Operations Control Centre, Asset Management and Service Delivery groups
- Continuing to refine calculations to minimise false positives
- Planned future expansion for other use cases and plant analytics
- Provided insight into operation of the system

TasWater and Nukon will continue to work collaboratively with Seeq on further model improvements and wider deployment to all high risk SPS sites.

Innovation

“This is the **first time this data has been used this way** in Tasmania and we are **excited** to be running this trial at the moment just east of Hobart at Midway Point”

“TasWater is **investing** significantly in the upgrade of sewage infrastructure around the state as part of the 10-year capital works plan. ...we’re hopeful this program can be used **wherever our assets are in high risk areas and significantly reduce the impact of spills and help TasWater work more responsively with shellfish growers for better outcomes**”

- Alexander Jovcic, Department Manager of Service Optimisation at TasWater
