About Nexa Resources

Mining

Zinc

Copper

Lead

Smelting

SHG Zinc

Zamac

Zinc Oxide

Zincal 200

In the form of granules, ingots or jumbos, it is used to produce alloys such as brass and bronze and in galvanizing processes

A highly resistant alloy of zinc-aluminum, magnesium and copper. It is present in the casting of countless industrialized metal products.

Obtained by volatilizing zinc metal, it creates products used in rubber, ceramics, chemicals, electronics and agriculture

An agricultural lime powder, a soil-neutralizing solution used to increase agricultural productivity.

BUSINESS CHALLENGES

Business Challenges

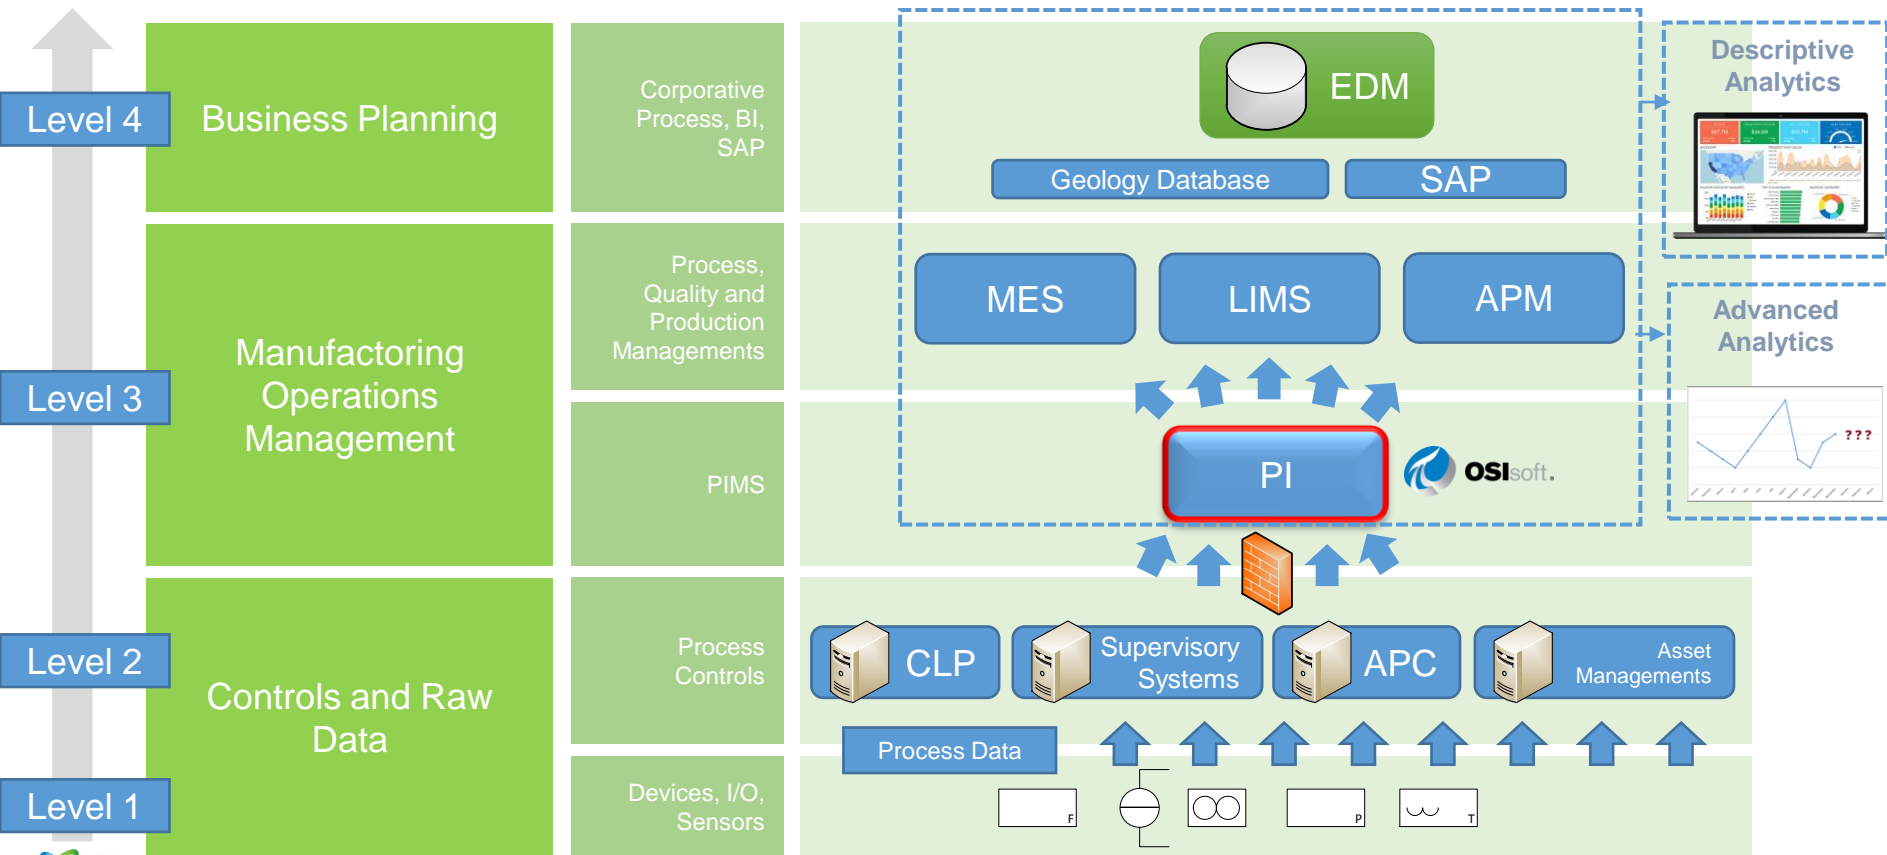

The main challenge that Nexa intends to overcome with this project is to provide intelligent solutions that allow the business areas to **grow, achieve maximum operating efficiency and reduce costs.**

Start our **Digital Transformation** and **Journey to Industry 4.0**, making **right decisions** based on **intelligent, fast and reliable information**

Digital Transformation at Nexa

Data Architecture for Nexa's Business

TECHNICAL CHALLENGES

Events Timeline for PI

Technical Challenges

Nexa Resources had the **PI System** installed on **5 out of their 6 major units**, but we were facing problems such as:

- **Low security and reliability of data infrastructure**
- **Dealing with different OsiSoft's contracts**
- **Outdated installations of PI System (2010 version)**
- **Inexistent asset management**
- **Lack of corporate standards and processes for PI**
- **Plenty of reports in excel and Processbook being shared across common network folders**
- **Few PI System specialists on the unities, and for most employees the PI System was a black-box which had the sole purpose of delivering data to their reports.**
- **Some unities in Peru did not have PI System (Cerro Lindo, El Porvenir and Atacocha)**

PI SYSTEM AND THE INDUSTRY 4.0

PI System And The Industry 4.0

Nexa Resources is attentive to market trends, including the technological and cultural transformations brought by the industry 4.0.

The PI System plays an important role in this transformation on NEXA:

- The structuring of data in **PI AF allows NEXA to easily feed analytics tools** with relevant structured information.
- **PI Analysis allows end-users to create calculated data that, upon creation, are already related to an element** and all its other information.
- **PI Notifications allows the machines and devices to “talk” to their users**, delivering important alarms in their phones.
- **PI Vision makes it possible to access plant information at anytime, anywhere from any device.**

RESULTS OBTAINED AND BUSINESS IMPACT

Results Obtained and Business Impact

The **corporate agreements** with OsiSoft and Radix provide **security and assurance** that NEXA's future needs and plans for PI will be met in the best way, with **standards, velocity and smaller cost**.

NEXA is operating with a much more **robust PI architecture** with high **reliability and security** in data collection and storage.

PI VISION* and **PI AF** have made data much more **accessible to users**, where information is structured in a way familiar to the users.

The procedures and processes are well defined in the PI Governance, ensuring **uniformity at the corporate level**.

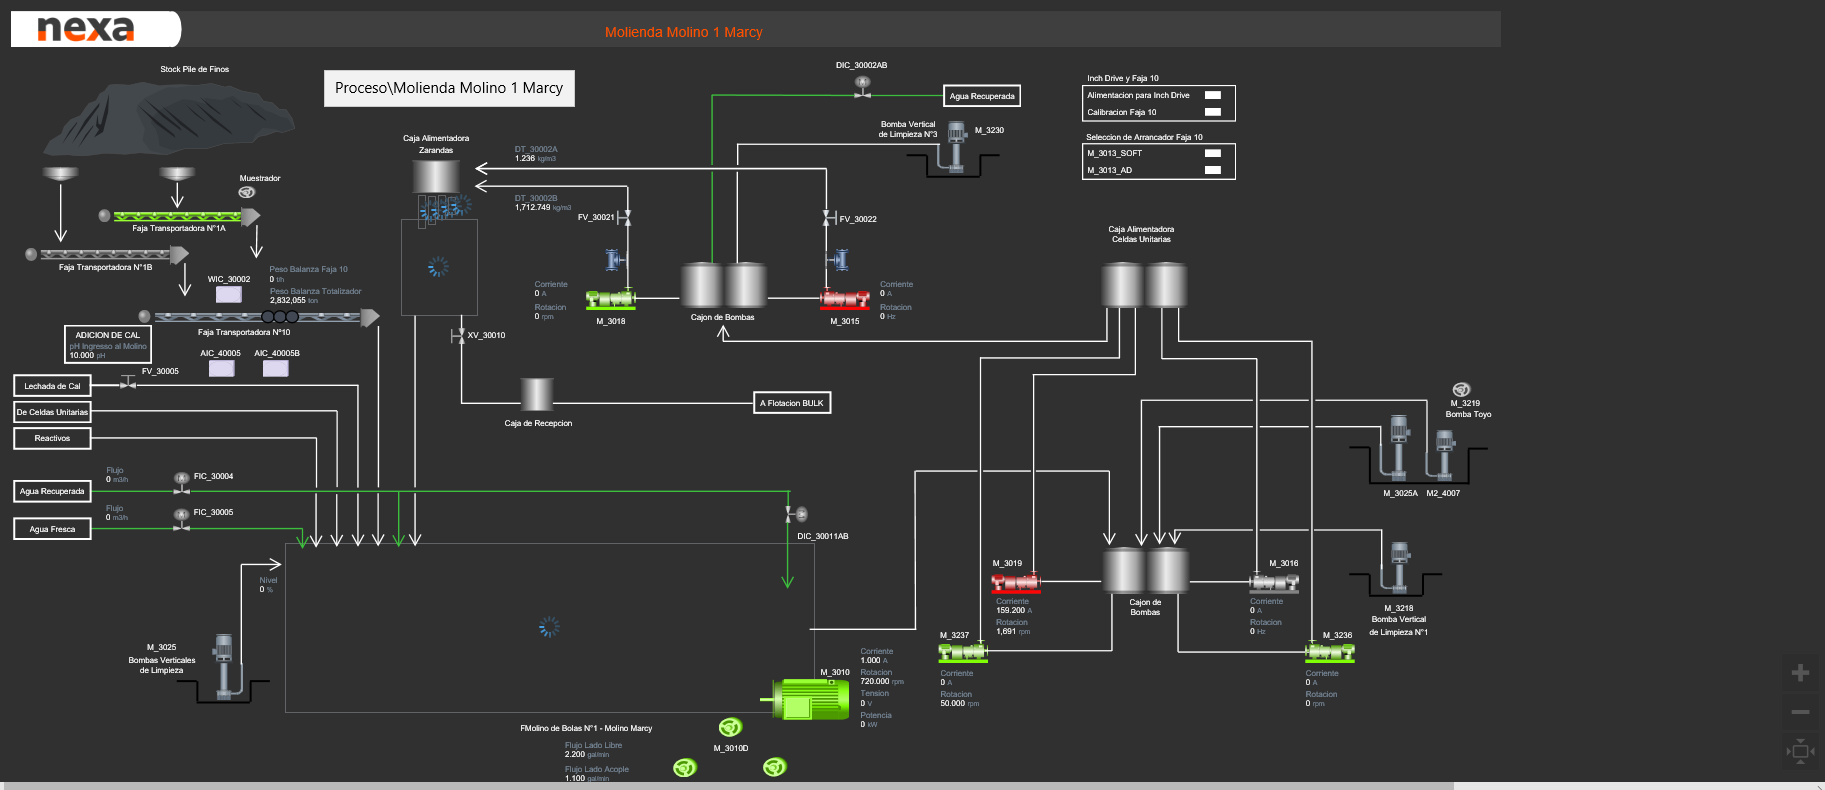

Results Obtained and Business Impact

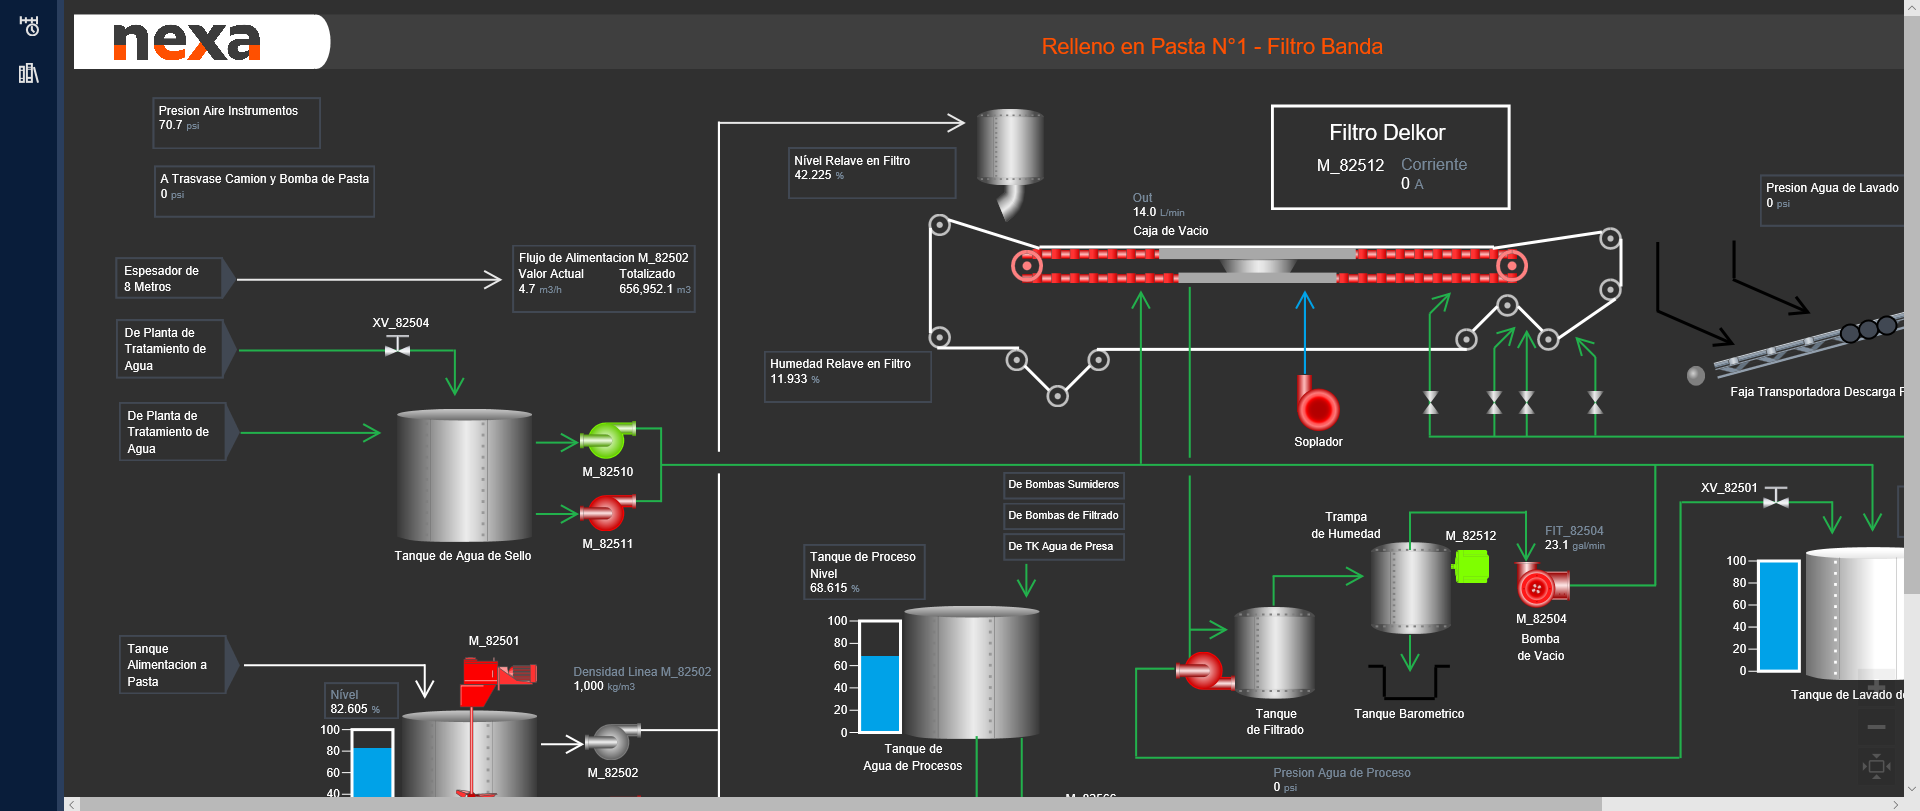

The PI System is no longer seen as a black-box by the end-users. Instead, the users are trained and motivated to create and share their own reports, using the PI System as a valuable work tool.

Furthermore, PI Consultants from Radix visited every Nexa plant, **seeking improvement opportunities in production, quality and security, to be achieved with improved usage of the PI System and its tools.** At first, they were able to identify:
