

# Sigmafine analyses for the PI System improve accuracy in process and supply chain management

Marco Lanteri  
Pimsoft S.p.A.

# Accuracy: who is right?

What is a fair value for both seller and buyer?

# Accuracy matters when evaluating KPIs

## Specific energy consumption per ton of valuable product

Product rate	9.6 t/h	±1.5%
Steam rate	5.1 t/h	± 2.5%
Steam latent heat	2168 MJ/t	± 0.5%
<b>Specific consumption</b>	<b>1152 MJ/t</b>	<b>± 3.0%</b>

What can be done to improve KPIs' accuracy?

# A path towards better accuracy

Accessibility

## **PI System archive**

From multiple data sources to  
one data lake

Contextualization

## **PI Asset Framework**

Data are structured in  
operational assets

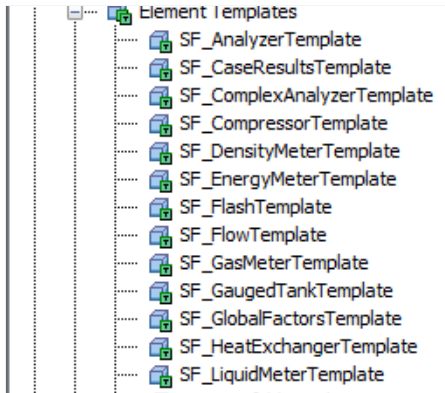

Reconciliation

## **Sigmafine**

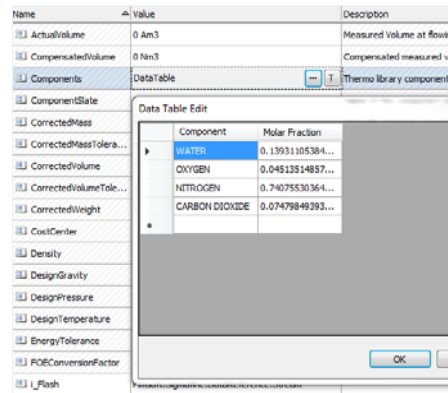

Assets are related together in a  
model and reconciled

# Sigmafine provides modeling capabilities plugged in the PI Asset Framework

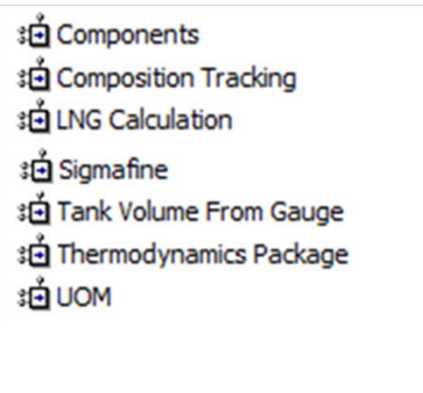

## Templates

Ready made template for equipment, tanks, meters,...

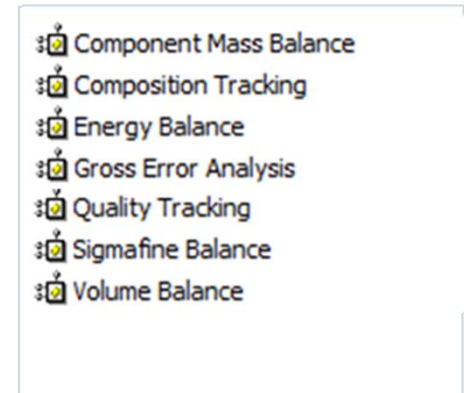

## Elements

Assets are joined together in a model

## Data references

Data preparation such as meter and inventory compensation, thermodynamic calculations, etc.

## Analyses

PI AF capabilities are extended with model based data reconciliation and tracking

# Sigmafine Overview

**Data Reconciliation**  
Mass, Volume,  
Energy, Component

**Tracking & Genealogy**  
Material, Ownership,  
Physical properties,  
Business categories

**Asset Database**  
Fully configurable and expandable

**Scalable in size**  
From 250 to 25000 assets

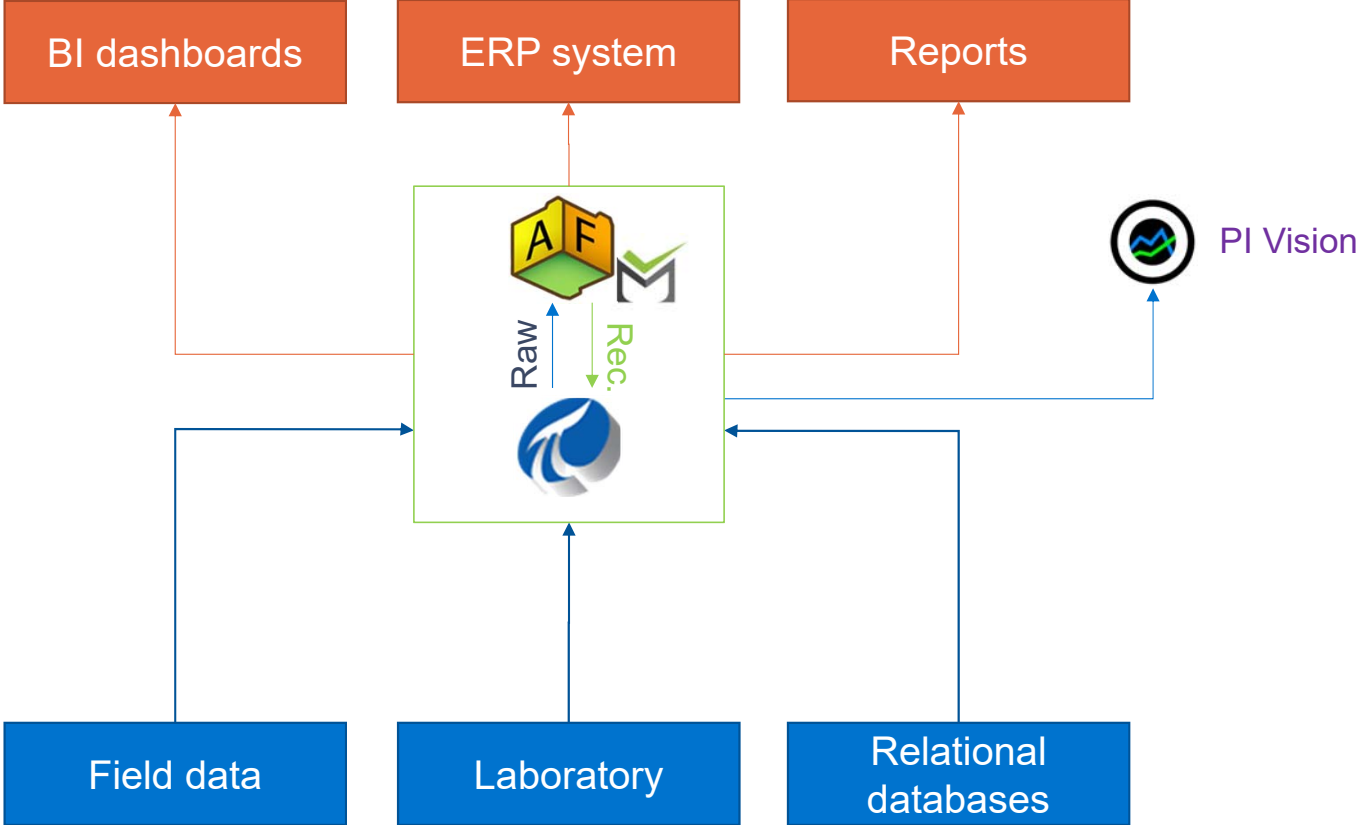

**Scalable in resolution**  
Hourly (or less), daily, monthly, on event

**Seamless Integration**  
PI system, Planning/Scheduling systems,  
Movement systems, ERPs, Business  
Intelligence

# Typical Architecture

# Sigmafine answers the accuracy problem

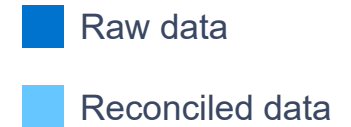

System uncertainty: **97.2 ± 1.37**

A fair value is **97.3 ± 0.32**

KPI uncertainty: **1152 ± 3.0%**

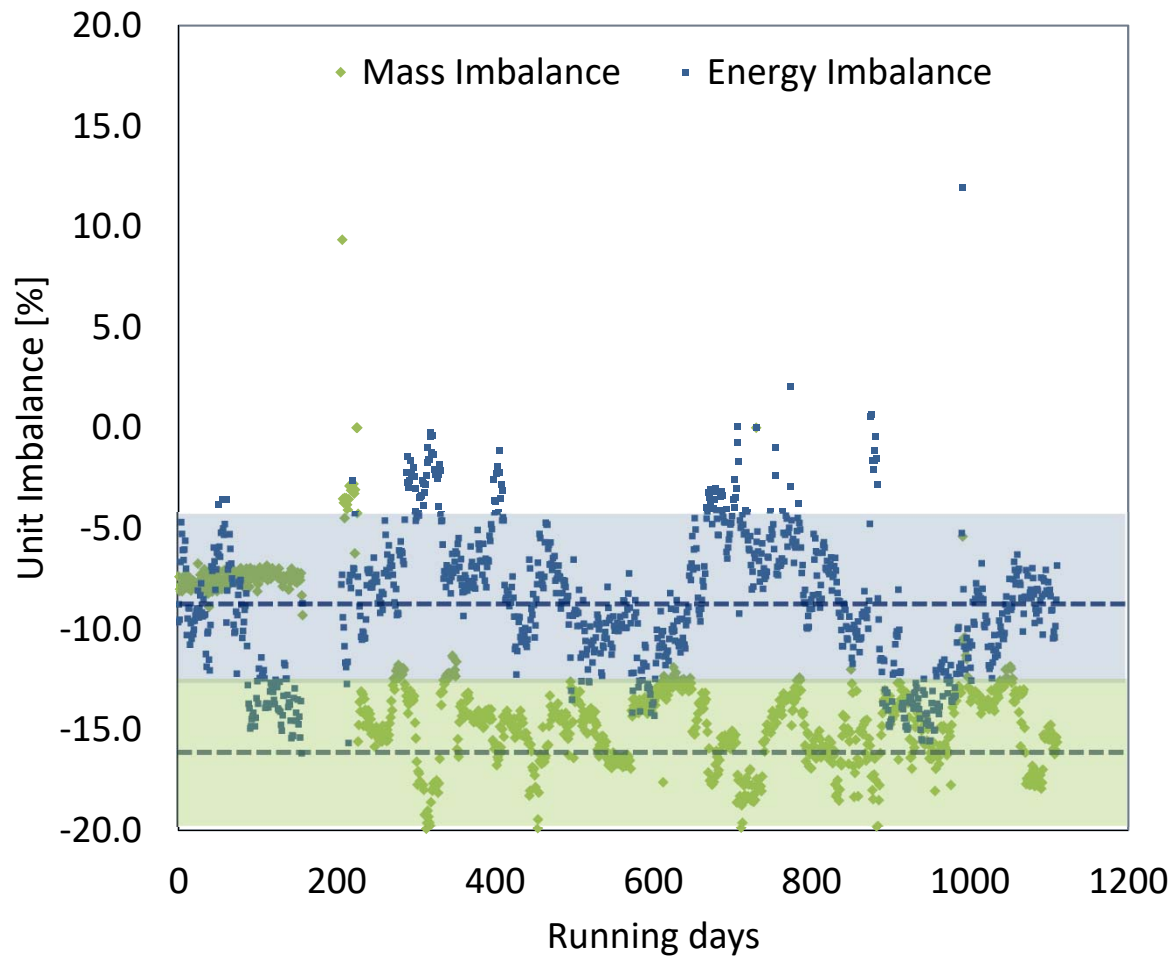

Reconciled KPI: **1096 ± 1.8%**

# Use case #1

Improve energy monitoring of an ethylbenzene-styrene purification column

## Ethylbenzene-Styrene purification column

### KPIs

Purity of top and bottom distillate

Steam consumption at reboiler

### Biased data

Mass imbalance: -14.9%

Energy imbalance: -8.3%

# Sigmafine model building blocks are PI AF assets

# Sharepoint based dashboard integrating PI system data and Sigmafine results

# Comparison of raw and reconciled based KPIs

# Model based performance monitoring

## Challenge

Improve monitoring and KPIs accuracy of the most energy intense equipment in the facility

## Solution

Analyse and reconcile raw data through Sigmafine asset based model and Thermodynamic app for the PI system and publish results in PI and on a web dashboard

## Benefits

Identified over-consumption of steam by reboiler in the range of 2000€/day

Increased accuracy associated to EnPIs required within the ISO 50001 framework; 6500€/day of creditable EECs\*

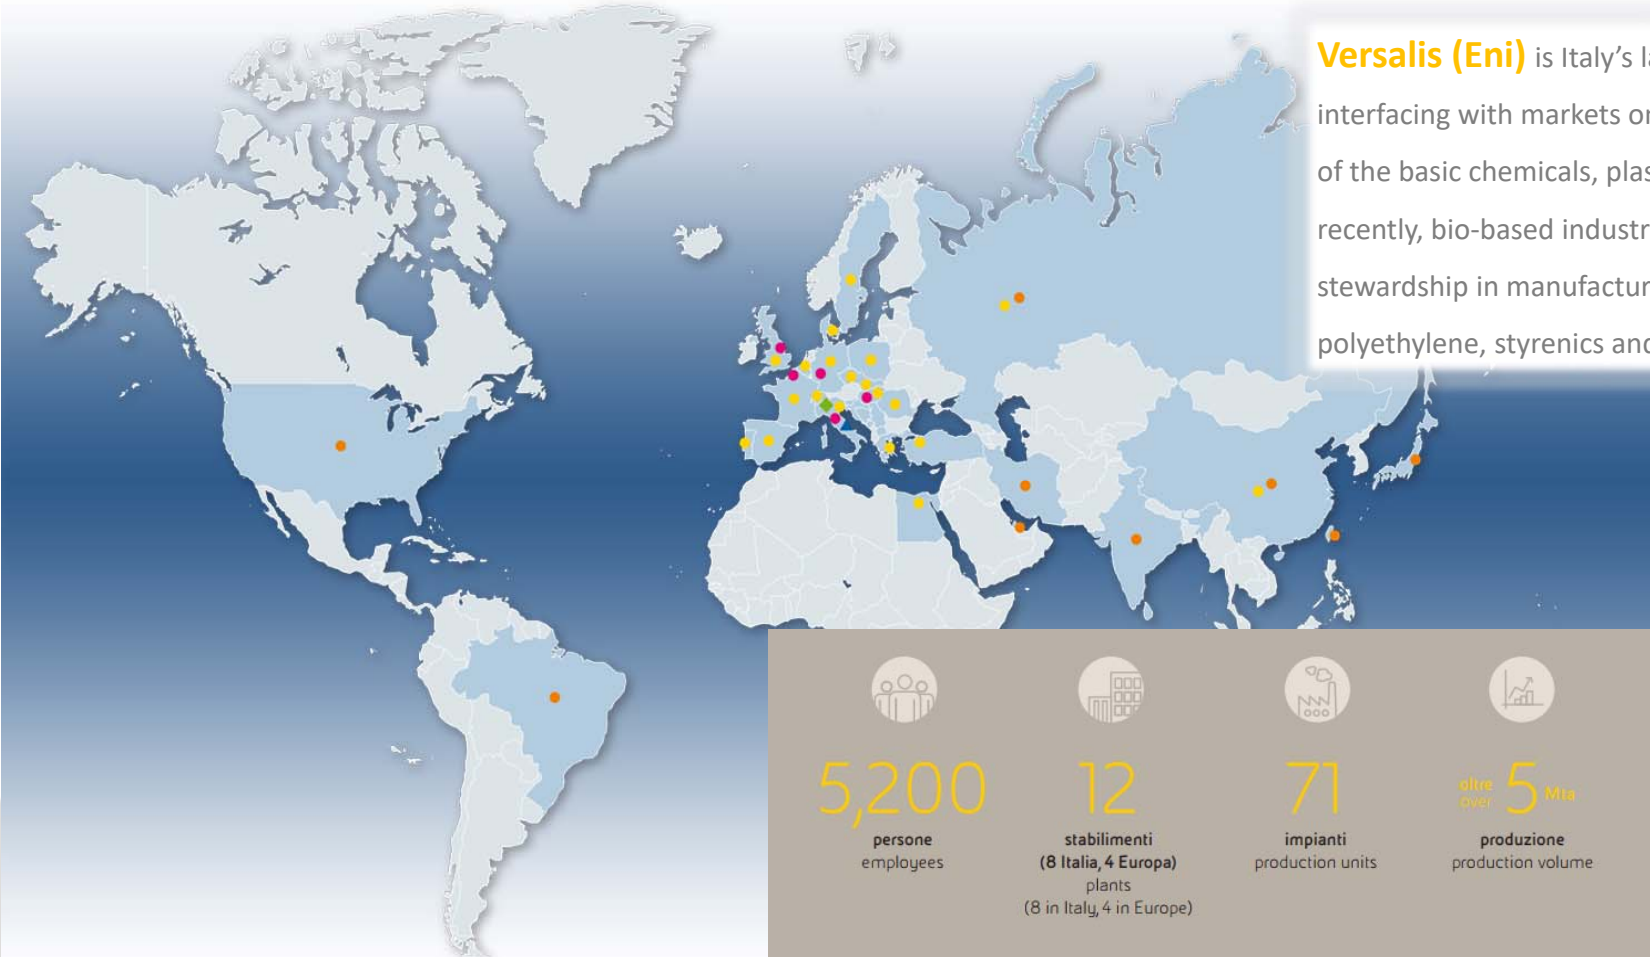

\*Assuming an Energy Efficiency Credit value of 100€

# Use case #2

Infer composition, monitor yield and improve supply chain of an aromatic plant

## Eni Chemicals, Versalis

**Versalis (Eni)** is Italy's largest chemical company interfacing with markets on the international scene of the basic chemicals, plastics, rubber and, recently, bio-based industry, holding market stewardship in manufacturing intermediates, polyethylene, styrenics and elastomers

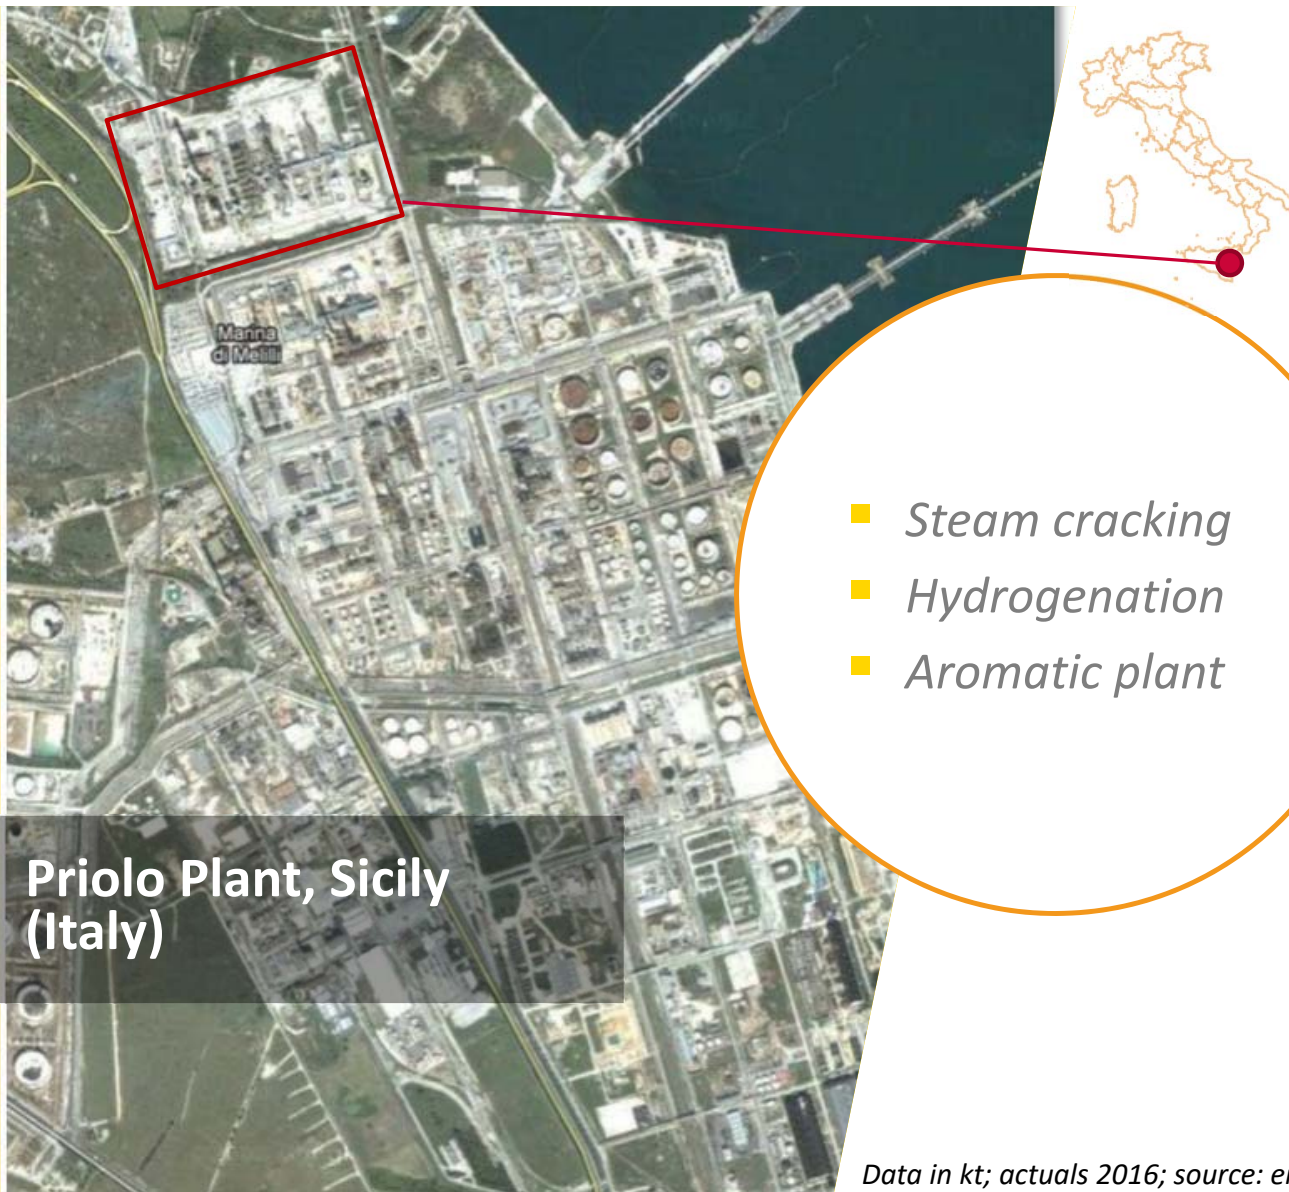

## The two data pillars of the MES infrastructure

---

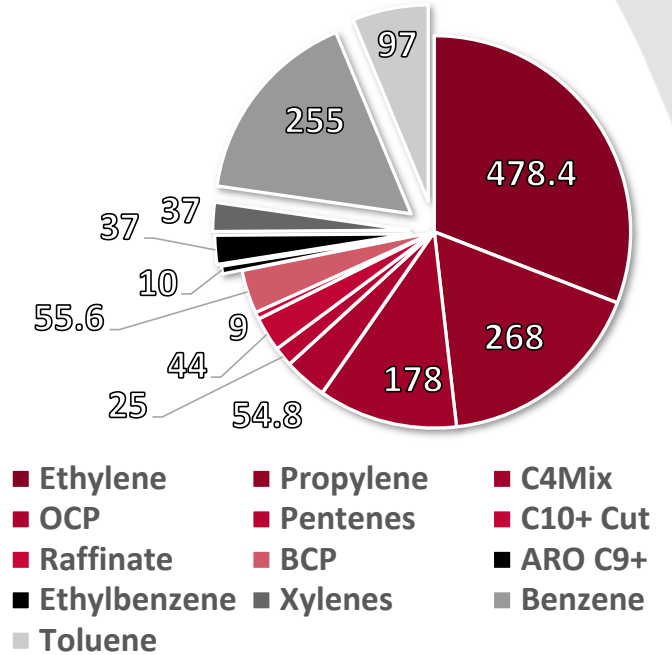

PI System

Sigmafine

- *Both Distributed and Centralized data infrastructure*
- *Production accounting*
- *Daily reconciliation and monthly aggregation*
- *Inventory checks and bill of material validation*
- *Auditing data chain (raw value, user validation, reconciled figure)*
- *Automatic Email notification*
- *Advanced algorithms (e.g. quality tracking)*

### Productions

### Raw Materials

Data in kt; actuals 2016; source: eni versalis

## Main target

### Daily Plant efficiency monitoring

- Daily monitoring of plant efficiency and yields to spot inconsistencies between expected and actual yields, resulting a faster and timely response and action

### Accurate daily inventories and consumption

- Get accurate daily inventories and consumption by material to update ERP material movements

**Strong correlation between material qualities and plant efficiency & production data**

## Data quality related issues for Aromatic plant

### *automated monitoring of unit feed quality*

#### **Data unavailability**

- Data regarding material qualities was available in different systems (even on paper record) and not integrated into one system
- Original balance system did not include daily quantity and composition of feeds → no relation between plant flow data and material properties
- Monitoring was done off-line and limited by manual effort in retrieving data day by day, feeding a spreadsheet

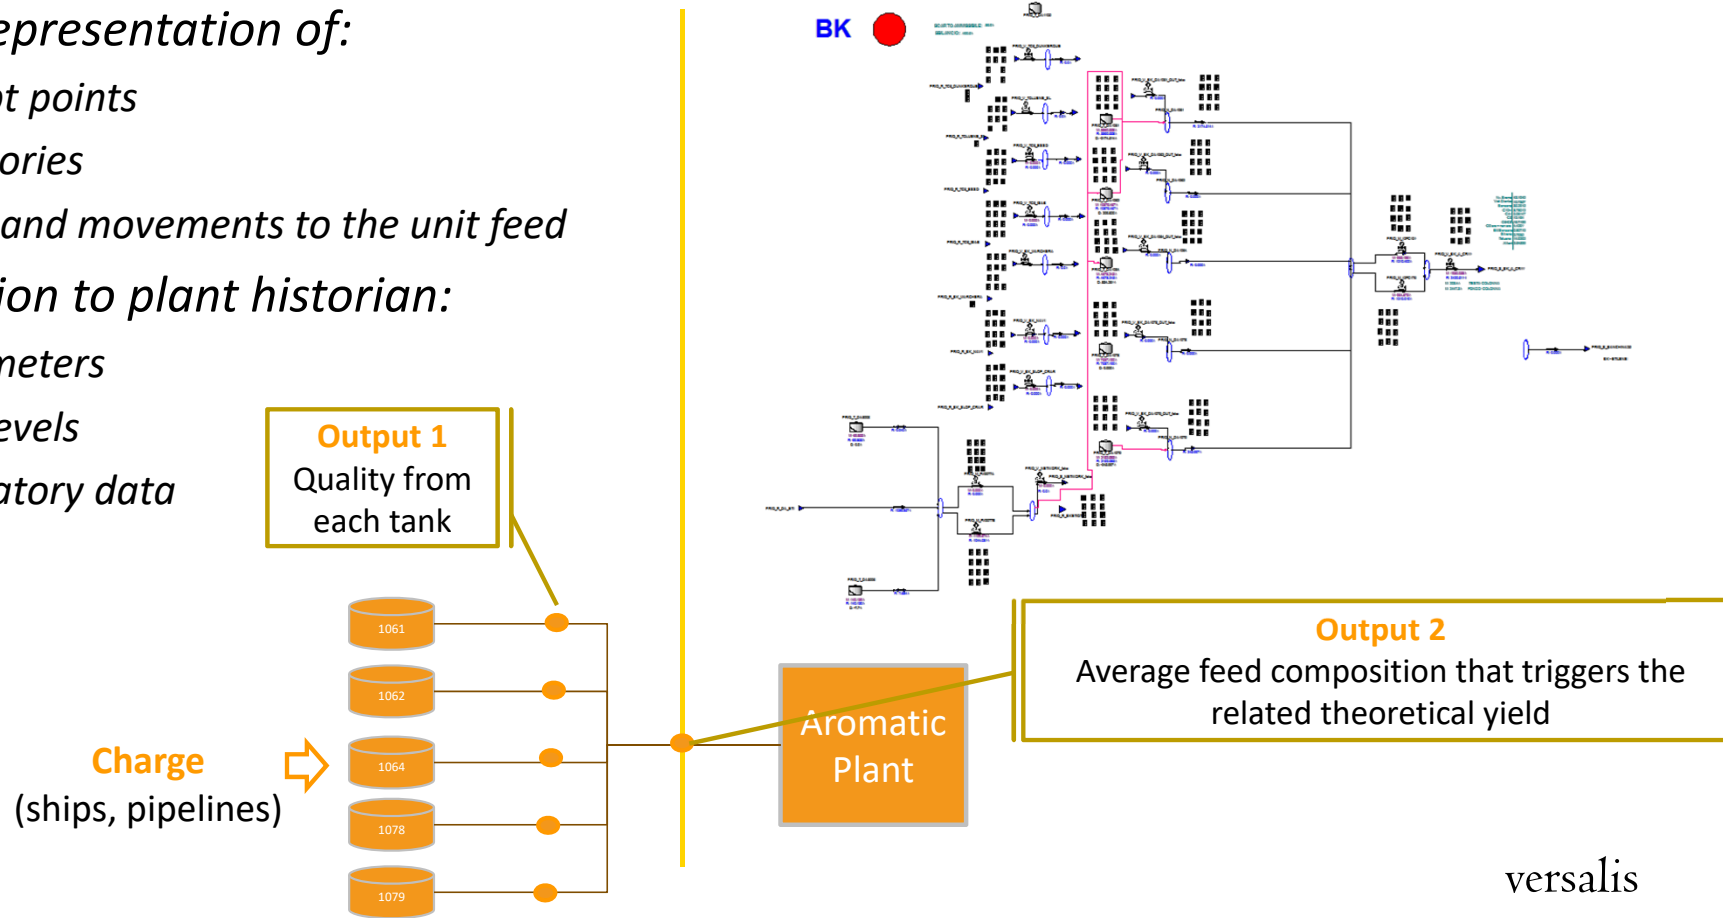

**Need of an automated solution that tracks most important qualities of the feed at least on a daily basis and related to actual plant data**

# Solution based on Sigmafine Quality Tracking for Aromatic Plant

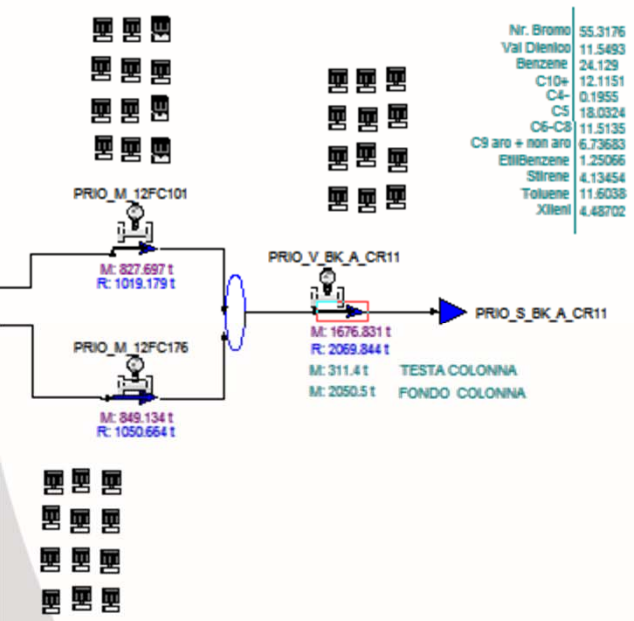

- *Model representation of:*
  - Receipt points
  - Inventories
  - Flows and movements to the unit feed
- *Connection to plant historian:*
  - Flow meters
  - Tank levels
  - Laboratory data

# Calculated qualities at plant feed point

## Overall Qualities at feed point

## Detailed Qualities by material

## Daily business value from Quality Tracking

# Improve supply chain management

## Challenge

Provide accurate inventories and plant yields to both improve operations and supply chain management

## Solution

Deployed PI system to aggregate process and lab data and introduced Sigmafine Quality tracking to infer material composition and qualities when lab data are not available

## Benefits

Reliable estimation of monthly production and average unit efficiency before month closure

Supply chain improved by changing the focus from monthly to daily operations, thus taking timely actions

## Some final thoughts...
