

Tips & Tricks for Managing Asset Analytics

Sebastien Raposo, Sr Product Support Engineer AF & Analytics

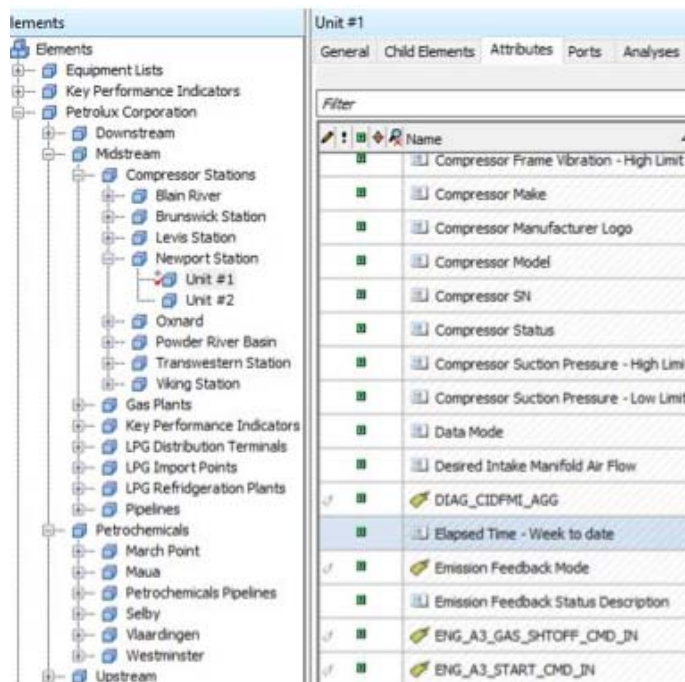

What is Asset Analytics?

- Core component of the PI Server
- Highly performant for streaming calculations
- Easy to use
 - Intuitive UI
 - Intellisense
 - Templatization (reusability)
 - 150+ built in functions
- Backfill, manual recalculation and auto-recalculation

Example use case

I want to detect possible issues with my asset

- AF used to model assets and processes (using templates)
- Inputs come from asset
- Outputs used in dashboards, reporting, triggering notifications, etc....

Typical symptoms of unhealthy Asset Analytics

Important Event - 2020-02-11 12:42:57.000 generated a new notification event.

Event: Important Event - 2020-02-11 12:42:57.000

Name: Notification Rule

Server: [Redacted]

Database: [Redacted]

Start Time: 2/11/2020 12:42:57 PM Central Standard Time (GMT-06:00:00)

Target: Element1

Severity: None

Send Time: 2/12/2020 12:45:37 PM Central Standard Time (GMT-06:00:00)

Objective

- After this talk, you should be able to manage and solve most of your issues with Asset Analytics
 - Pareto Principle (80/20 Rule)
- Or, if you are a new user, you will be able to get started on the right track

Agenda

- Monitoring
 - Service level with Performance Counters
 - Analysis level with AFSDK
- Diagnosing (identifying culprit analyses)
 - Service Statistics
 - PI System Explorer
 - Log
- Best Practices
- Troubleshooting

Performance Counters

PI Vision

Performance Counters - AFValues Written

- Good: Values are continuously increasing
- Bad: Values are stuck at 0 or flat lined

Good

Bad

Performance Counters - Maximum Latency

- Good: Value is constantly around 5s OR lower than tolerated latency (depends on use case)
- Ok: Value temporarily goes up and then comes back down (step behavior)
- Bad: Value is consistently increasing

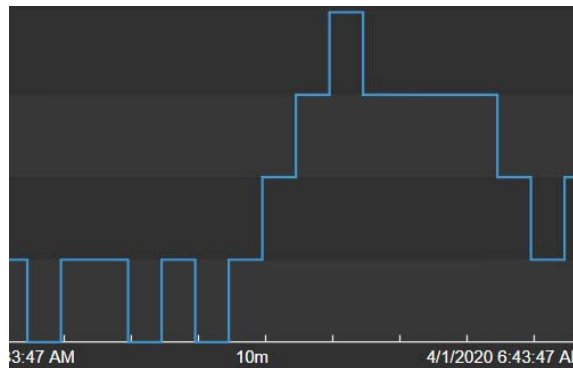

Maximum Latency

Good

Bad

Depends...

Performance Counters – Evaluation Skipped Count

- Good: Value is constantly 0
- Ok: Value temporarily goes then flat lines
- Bad: Value is consistently increasing

Evaluation Skipped Count

Good

Bad

It depends...

Other performance counters ([Documentation](#))

- Analyses in Error / Running / Suspended
- Cache Hit Count / Miss Count
- Evaluation Count / Error Count / OOO Ignored Count
- EF Written
- Events Cached / Processed
- Recalculation Requests Completed / Queued

Programmatic access to run time statistics via AFSDK (2018 SP2)

- Retrieve statistics for particular analyses, such as:
 - Evaluation time
 - Triggering Rate
 - State (Error, Running, etc...)
 - Skip Count

AFSDK access - Resources

- PI Square [post](#) on overview
- PI Square [post](#) on example PS1 script
- [Presentation](#) at PI World 2019

Analysis Search Demo

AF Server: DAVIDP-CURRENT

Query: status :in ('running', 'warning') lastLag:> 7000

Fields: name skipCount lastLag lastElapsed averageTrigger path

Search

Count:2

name	skipCount	lastLag	lastElapsed	averageTrigger
Lifetime Production Monthly	397389	16266.9822	902.307200000000008	744.49217278114611
Production Spike	0	1905744.9722000002	862.6785	10602.382159148505

Service Statistics

- Documentation [here](#) to retrieve statistics
- Great PI Square post [here](#) on how to analyze the statistics

Operations

[Enable](#) | [Disable](#) selected analyses

[Enable](#) | [Disable](#) automatic recalculation for selected analyses

[Queue](#) | [Cancel](#) backfilling or recalculation for selected analyses

[View Analysis Service Statistics](#)

[Edit Analysis Service Configuration](#)

[Open Recalculation Log Folder](#)

How to automate detection of culprit analyses?

- Programmatic access to runtime statistics introduced in 2018 SP2...
- Example for latency:

```
$query = "status:'Running' averageLag>'60000'  
sortBy:'averageLag' sortOrder:'Desc'"
```

```
$fields = "path lastEvaluationStatus  
lastEvaluationStatusDetail lastLag averageLag  
averageElapsed averageTrigger"
```

Automate monitoring with AF SDK

PI Vision

Best Practices

- PI Analysis Service Best Practice article has to be read before troubleshooting

Troubleshooting – Approach taken by OSIsoft Product Specialist

- Assumptions:
 - Culprit analyses have been identified
 - Best Practice [article](#) has been read
- Look at analysis configuration (calculations and scheduling)
- Look at analysis inputs

Analysis Configuration

- Are there any expensive functions
 - Long summary function (Example TagAvg() over a month...)
- Are there any repeating functions with same inputs
- Does the scheduling make sense with what the analysis is doing

Inputs

- Are any of the inputs in error?
 - Handling with BadVal() is ok, but if the error can be prevented that is better
- What's the data density of the inputs?
 - Events every second, minute, etc...
- What are the data references?
 - Any expensive formulas or table lookups etc...

Example 1

Name	Expression
vEnergyInKwh	TagTot('Power Draw', '01-jan', '*')*24

Scheduling: ☐ Event-Triggered ☒ Periodic

Period: 00h 05m 00s [Configure](#)

- Scheduling is too aggressive and/or time range in summary function is too long

Name	Expression	Output Attribute
vEnergyInKwh	if Day('*') = 1 and Month('*') = 1 then 0 else TagTot('Power Draw', 'y', 't') + 'Energy Consumption'	Energy Consumption

Scheduling: ☐ Event-Triggered ☒ Periodic

Run every day at 12:00 AM [Configure](#)

Example 2

Name	Expression
vVolume	'Length'*'Width'*'Level'

Scheduling: ☒ Event-Triggered ☐ Periodic

Trigger on: Level

 Length	Table Lookup
 Level	PI Point
 Volume	PI Point
 Width	Table Lookup

Table1. 1124335 Rows.

- Slow analysis has a simple configuration. Issue is with a dense input
- Solution: Reduce size of table! Can be done using parametrized queries

Example 3

Name	Expression
vState	<pre>If BadVal(TagMax('input','*','-24h')) Then "Bad Value" else if TagMax('input','*','-24h') > 0 and TagMax('input','*','-24h') < 50 then "Low" else if TagMax('input','*','-24h') > 50 and TagMax('input','*','-24h') < 100 then "Average" Else "High"</pre>

Name	Expression
vMax	<pre>TagMax('input','*','-24h')</pre>
vState	<pre>If BadVal(vMax) Then "Bad Value" else if vMax > 0 and vMax < 50 then "Low" else if vMax > 50 and vMax < 100 then "Average" Else "High"</pre>

Use a variable to avoid running the same calculation multiple times

System Best practices

- Use latest version
- Hardware sizing for SQL and Analysis
 - We have a sizing guideline
- Dedicated node for Analysis for large scale deployment
- Asset Analytics server should be “close” to Data Archive and AF Server (and any external system it connects to)

System Best Practices - Continued

- Use templates
- Use proper compression settings
- Minimize out of order data
 - This is true for the PI System, not specific to Asset Analytics

There is a limit to every system

- Asset Analytics can scale to a large number of Analyses!
 - The amount depends..
- If all analyses follow best practices and there are still issues with the system OR any change causes the system to tip to a bad state... might be time to split the system.
