# AF Analytics: Best Practices and Troubleshooting

Presented by: Pascal Schwab and Kevin Geneva

**AVEVA**

# Presentation Agenda

- Intros
- Best practices for PI Analysis Service
  - Server defaults
  - Evaluation threads
- Best practices for analyses
  - Part 1: Use Variables
  - Part 2: Data Density and Data Pattern
  - Part 3: Input Attributes
  - Part 4: Analyses in Warning or Error
  - Part 5: Scheduling
- Monitoring
- What's up and coming?
- Questions

$f(x)$

# PI Analysis Best Practices

# Overall Service

How can we help the service use all the power of its machine?

- Adjust Number of Evaluation Threads
  - Make use of entire CPU
- Adjust Events to Queue Before Skipping
  - Minimize skipped evaluations
- Adjust Number of Recalculation Threads
  - Improve recalculation experience
- Use templates
  - Help the service with scheduling
- Proactively monitor the service health
  - Use PI Interface for Performance Monitoring

• **Call PI Technical Support  
before changing server-  
wide configuration!**

# Use Variables

What is easier to calculate if we need to do several tasks in parallel?

- $$X = (V_1 * T^{V_2} + V_3) * He * \frac{\frac{\bar{M} * p}{\mathbb{R} * T}}{\frac{\bar{M} * 611.2 * \exp\left(\frac{17.62 * T}{243.12 + T}\right)}{\mathbb{R} * T}}$$

- $$p_{sat} = 611.2 * \exp\left(\frac{17.62 * T}{243.12 + T}\right)$$

- $$f = \frac{\bar{M} * p}{\mathbb{R} * T}$$

- $$f_{sat} = \frac{\bar{M} * p_{sat}}{\mathbb{R} * T}$$

- $$\rho = \frac{f}{f_{sat}}$$

- $$V = (V_1 * T^{V_2} + V_3) * He$$

- $$X = V * \rho$$

- where

- T, p are measurement data

- $V_1, V_2, V_3, He, \bar{M}, \mathbb{R}$  are (material-specific) constants

---

# Use Variables

What is easier to calculate if we need to do several tasks in parallel?

- Keep analysis from doing identical tasks multiple times
- Simplify scheduling
- Avoid multiple calls for the same data
- Easier readable for users
- Keep syntax simple
  - Speeds up evaluation

# Data Density and Data Pattern

Do we really need this many events to be stored?

# Data Density and Data Pattern

Do we really need this many events to be stored?

# Data Density and Data Pattern

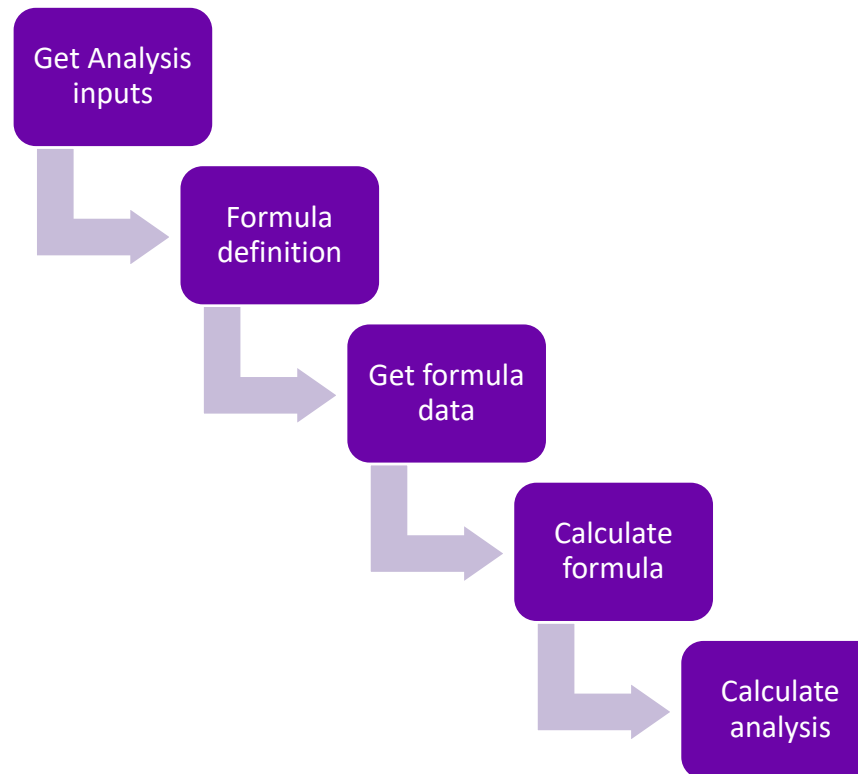

Do we really need this many events to be stored?

- Do not send more data to PI than needed
  - Review Exception and Compression settings
  - Review Data Source
- Use periodic scheduling to control data density

# Input Attributes

## Where does our data come from?

- Use PI Points wherever possible
- For Table Lookups
  - Use Parametrized Queries
  - Keep Tables as small as possible
- Try to avoid Formula Data References
- Try to avoid extensive Analysis Data References

# Analyses in Warning or Error

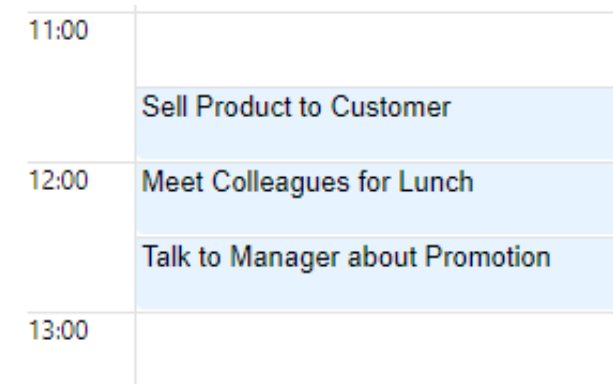

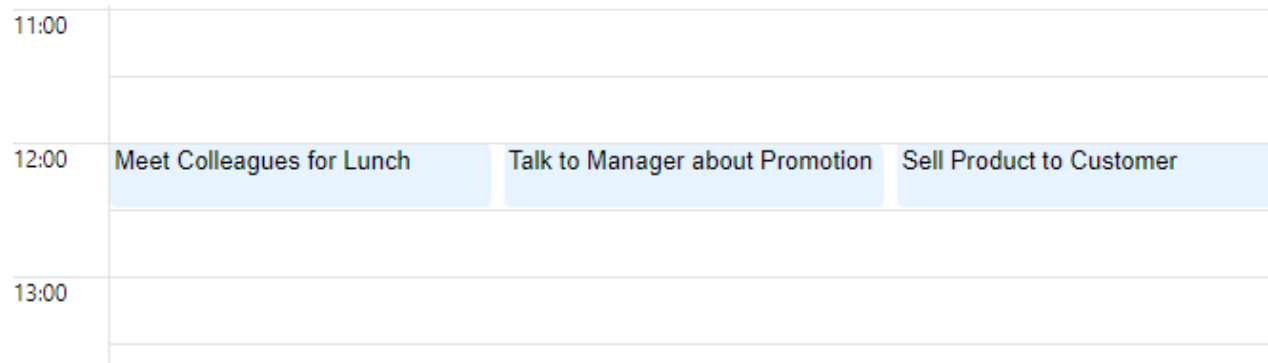

## Why are our Log Files growing that much?

- Analysis Service tries to restart analyses in error every 15 minutes
- Writing to the log is expensive

Analyses					
4 total analyses selected (4 on this page)					
<input checked="" type="checkbox"/>	Status			Element	Name
<input checked="" type="checkbox"/>				Element 4	Analysis_in_Error
<input checked="" type="checkbox"/>				Element 3	Analysis_in_Error
<input checked="" type="checkbox"/>				Element 1	Analysis_in_Error
<input checked="" type="checkbox"/>				Element 2	Analysis_in_Error

# Scheduling

How can we help planning an execution?

# Scheduling

How can we help planning an execution?

- Use templates
- Periodic scheduling gives you control
  - Use offsets
- Natural scheduling is controlled by the data source

# Finding the ~~needle~~ in the haystack elephant

AVEVA

# What does a struggling PI Analysis Service look like?

- **Evaluation Skipped Count** keeps increasing
- **Maximum Latency** is high
- **Evaluation Count** has reached max capacity

$f(x)$

# Proactive monitoring

- Use PI Interface for Performance Monitor
- Build logic to alert for issues
- Services engagement available to assist

# Trademarks of a bad analysis

- Long-running
- Calculated too often
- Long dependency chain

# How can I tell which Analyses are misconfigured?

We're already in a bad state...

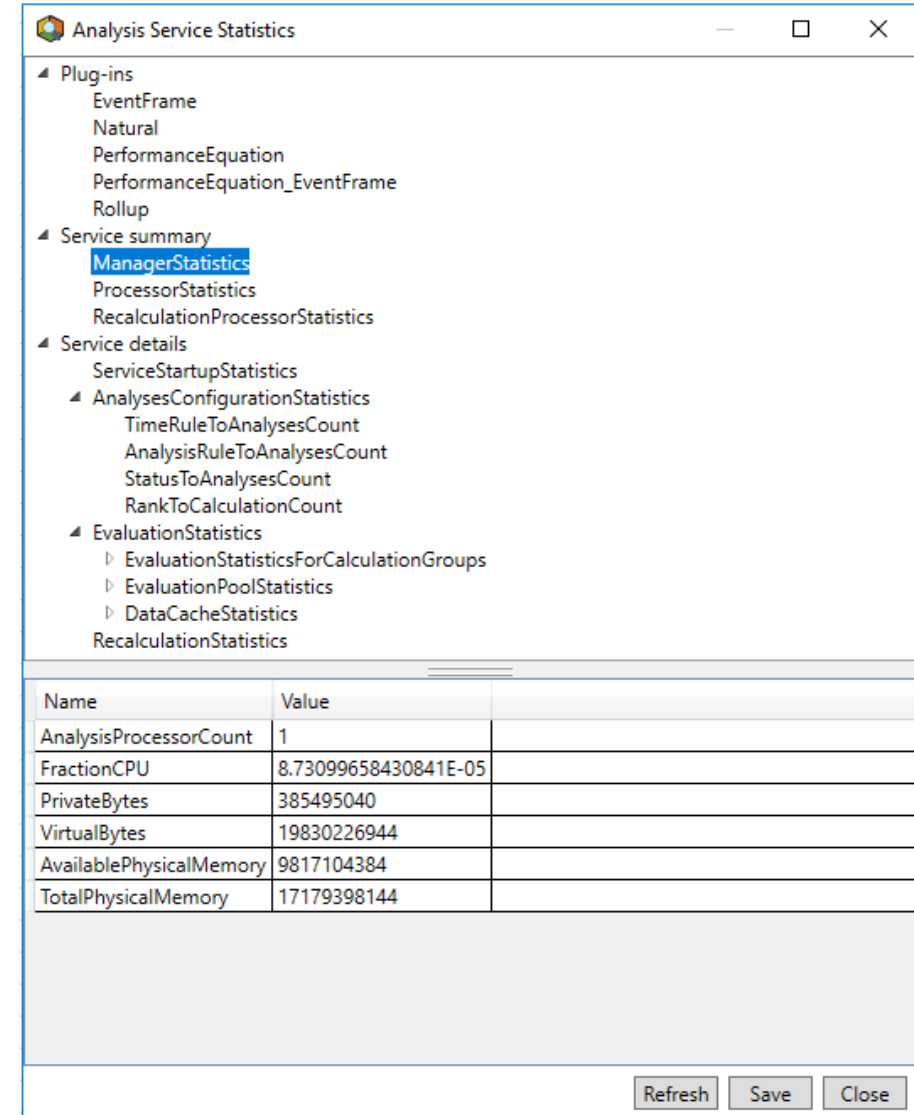

- Today
  - Contact support or schedule a Service engagement
- Coming soon
  - Self-service tools to identify expensive analyses

# Planned enhancements

## Currently being worked on

- Easily identify expensive analytics
- Visually represent service health
- Usability improvements of the management pane

The screenshot shows a window titled 'Analysis Service Statistics'. It contains a tree view on the left with the following structure:

- Plug-ins
  - EventFrame
  - Natural
  - PerformanceEquation
  - PerformanceEquation\_EventFrame
  - Rollup
- Service summary
  - ManagerStatistics**
  - ProcessorStatistics
  - RecalculationProcessorStatistics
- Service details
  - ServiceStartupStatistics
    - AnalysesConfigurationStatistics
      - TimeRuleToAnalysesCount
      - AnalysisRuleToAnalysesCount
      - StatusToAnalysesCount
      - RankToCalculationCount
    - EvaluationStatistics
      - EvaluationStatisticsForCalculationGroups
      - EvaluationPoolStatistics
      - DataCacheStatistics
    - RecalculationStatistics

Below the tree view is a table with the following data:

Name	Value
AnalysisProcessorCount	1
FractionCPU	8.73099658430841E-05
PrivateBytes	385495040
VirtualBytes	19830226944
AvailablePhysicalMemory	9817104384
TotalPhysicalMemory	17179398144

At the bottom right of the window are three buttons: 'Refresh', 'Save', and 'Close'.

#### ABOUT AVEVA

AVEVA is a global leader in industrial software, driving digital transformation and sustainability. By connecting the power of information and artificial intelligence with human insight, AVEVA enables teams to use their data to unlock new value. We call this Performance Intelligence. AVEVA's comprehensive portfolio enables more than 20,000 industrial enterprises to engineer smarter, operate better and drive sustainable efficiency. AVEVA supports customers through a trusted ecosystem that includes 5,500 partners and 5,700 certified developers around the world. The company is headquartered in Cambridge, UK, with over 6,500 employees and 90 offices in over 40 countries.
