AGENDA

- Data Ingress
 - SDS Type Definition
 - SDS API vs OMF
 - Best Practices
 - DEMO!!!!
- Data Egress
 - Streams vs Assets vs Data views
 - DEMO!!!!

The Power of AVEVA™ Connect

AVEVA Connect enables a hybrid data architecture through cloud offerings

AVEVA Data Hub

Remote monitoring

Data science & AI/ML platforms

3rd party analytic tools

Data sharing with business partners

Custom & partner applications

Reporting & Dashboards

A cloud-native industrial platform designed for aggregating, storing, enriching, accessing, analyzing, and securely sharing real-time operations data from historians, edge devices, and more

- Managed, secure, multi-tenant platform
- Operated & maintained by AVEVA
- High speed, scalable, elastic, & resilient
- Modern, secure REST APIs
- Built & deployed on Microsoft Azure

OMF Apps & Remote assets

AVEVA Adapters

Edge Data Store

AVEVA PI Server

AVEVA Historian

AVEVA System Platform

Cloud apps & silos

AVEVA Data Hub

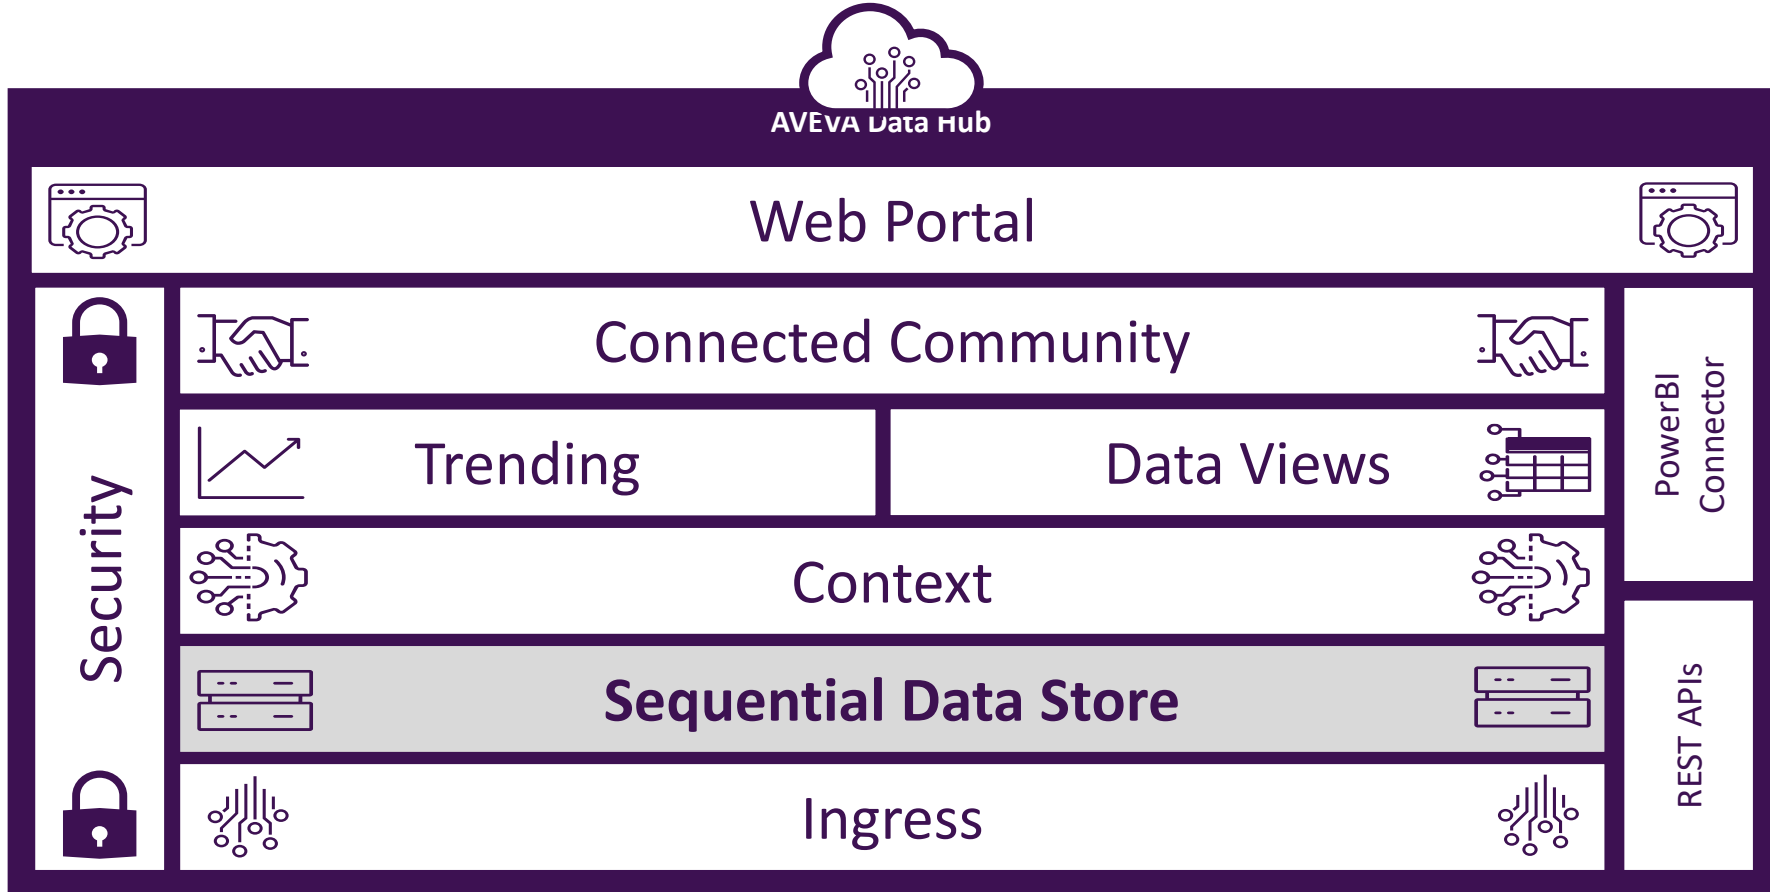

A cloud-native industrial platform designed for aggregating, storing, enriching, accessing, analyzing, and securely sharing real-time operations data from historians, edge devices, and more

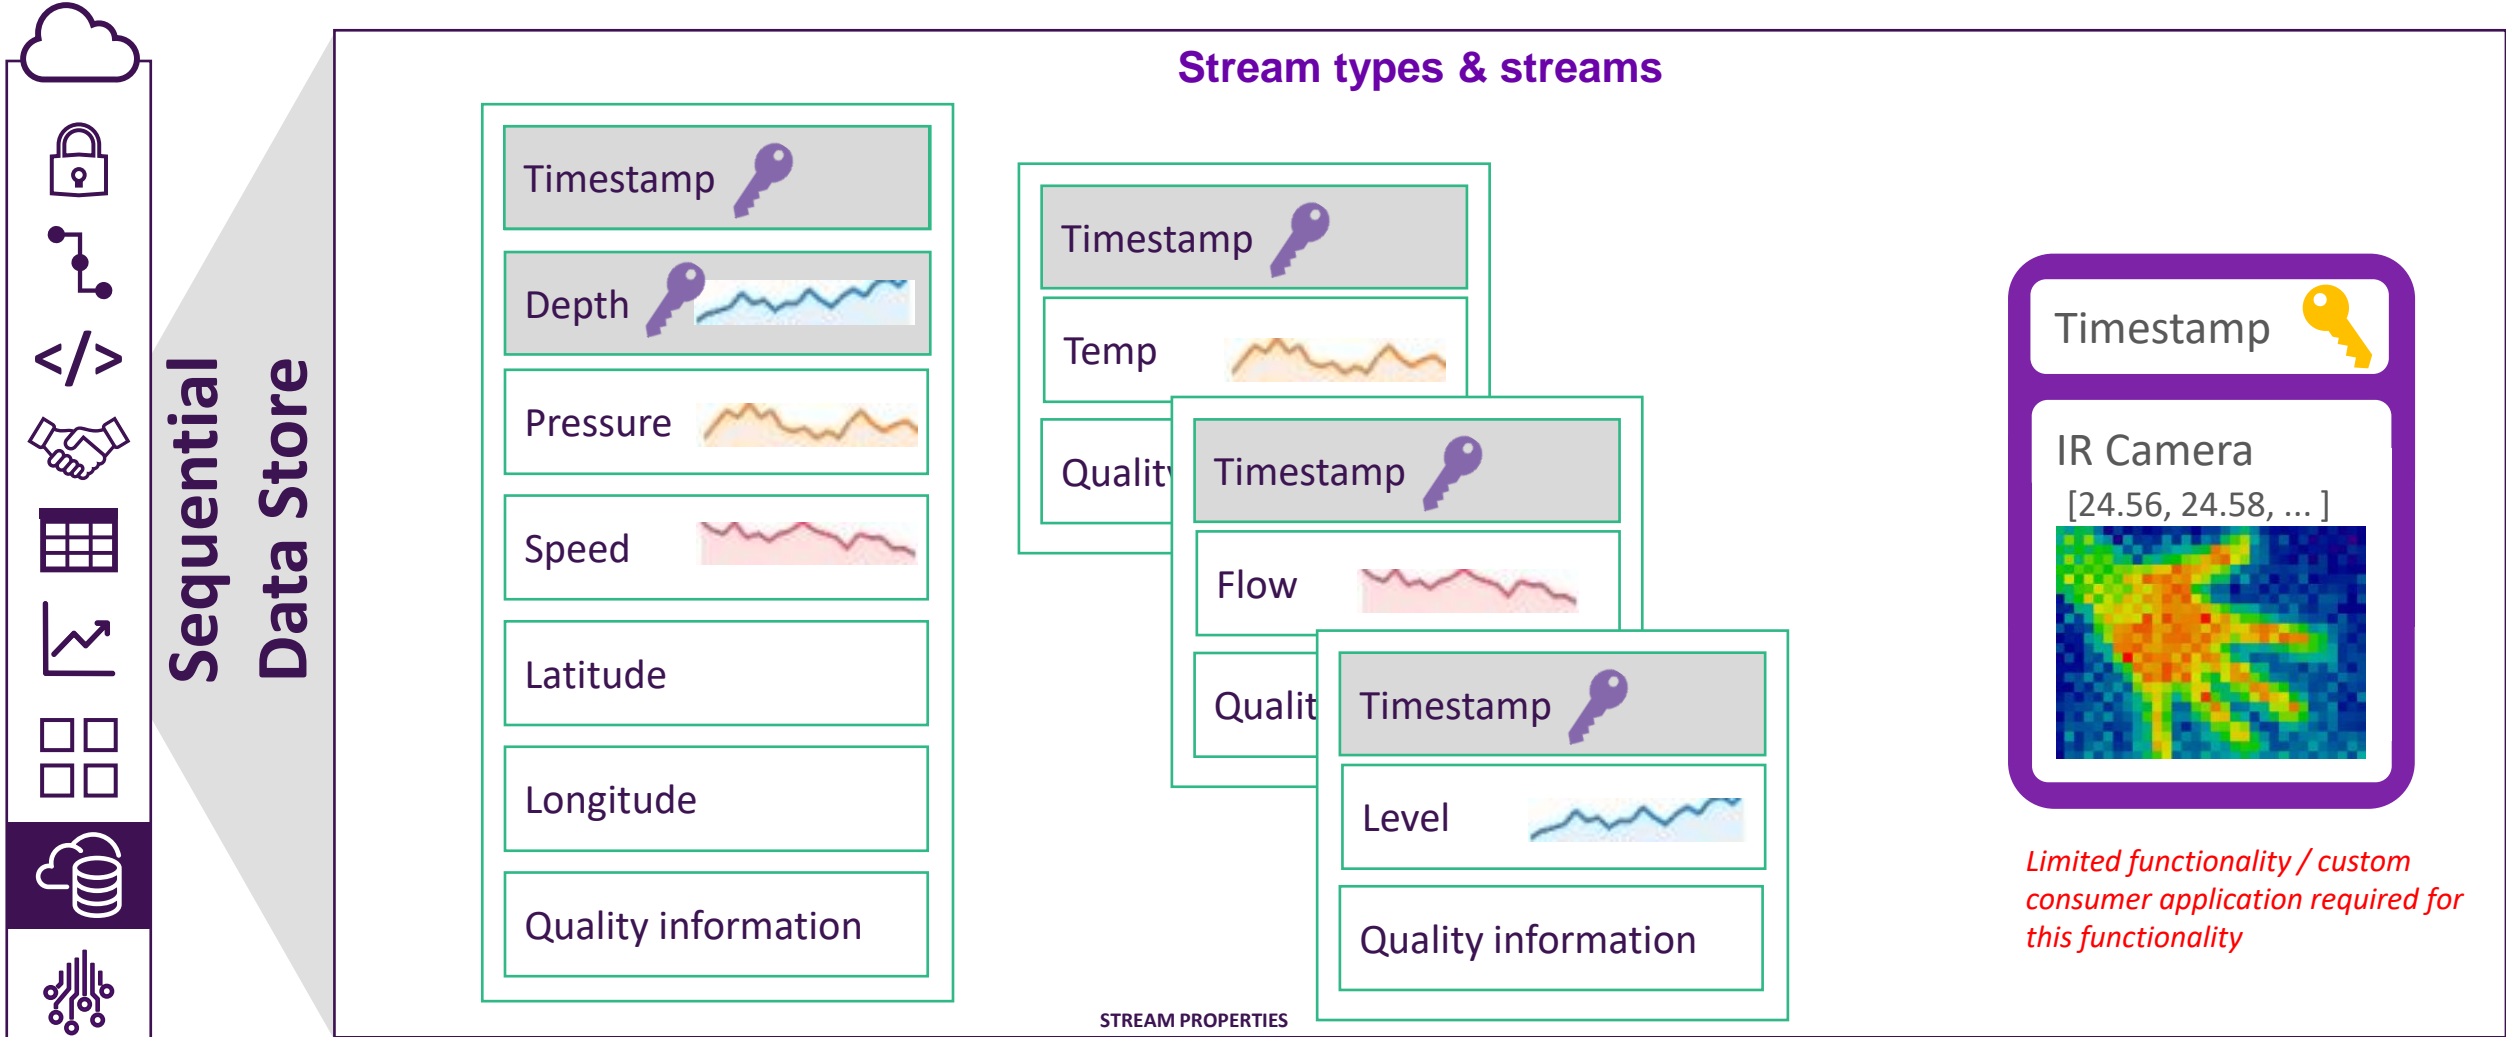

- Managed, secure, multi-tenant platform
- Operated & maintained by AVEVA
- High speed, scalable, elastic, & resilient
- Modern, secure REST APIs
- Built & deployed on Microsoft Azure

Supported Regions
 West US (California)
 North Europe (Ireland)
 Australia East (New South Wales)

Sequential Data Store

Flexible *Sequential Data Store* that keeps related data together

Complex vs Simple Types

What is a simple type?

- Key-Value pair
- Often Timestamp Value
- Adapters
- PI Server
- AVEVA Historian

```
{  
  "Timestamp": "2023-07-17T21:12:08.1915788Z",  
  "Temperature": 0  
}
```

```
{  
  "Timestamp": "2023-02-08T02:51:58.707077Z",  
  "Value": 0,  
  "IsQuestionable": false,  
  "IsSubstituted": false,  
  "IsAnnotated": false,  
  "SystemStateCode": null,  
  "DigitalStateName": null  
}
```

```
{  
  "Timestamp": "2022-02-03T16:13:09.27763Z",  
  "ParticleCount0.3": 408,  
  "ParticleCount0.5": 134,  
  "ParticleCount1.0": 17,  
  "ParticleCount2.5": 4,  
  "ParticleCount5.0": 2,  
  "ParticleCount10.0": 2,  
  "PM1.0S": 2,  
  "PM1.0E": 2,  
  "PM2.5S": 2,  
  "PM2.5E": 2,  
  "PM10S": 5,  
  "PM10E": 5  
}
```

Complex vs Simple Types

What is a complex type?

- Key with multiple properties
- Compound indices
- Nested types

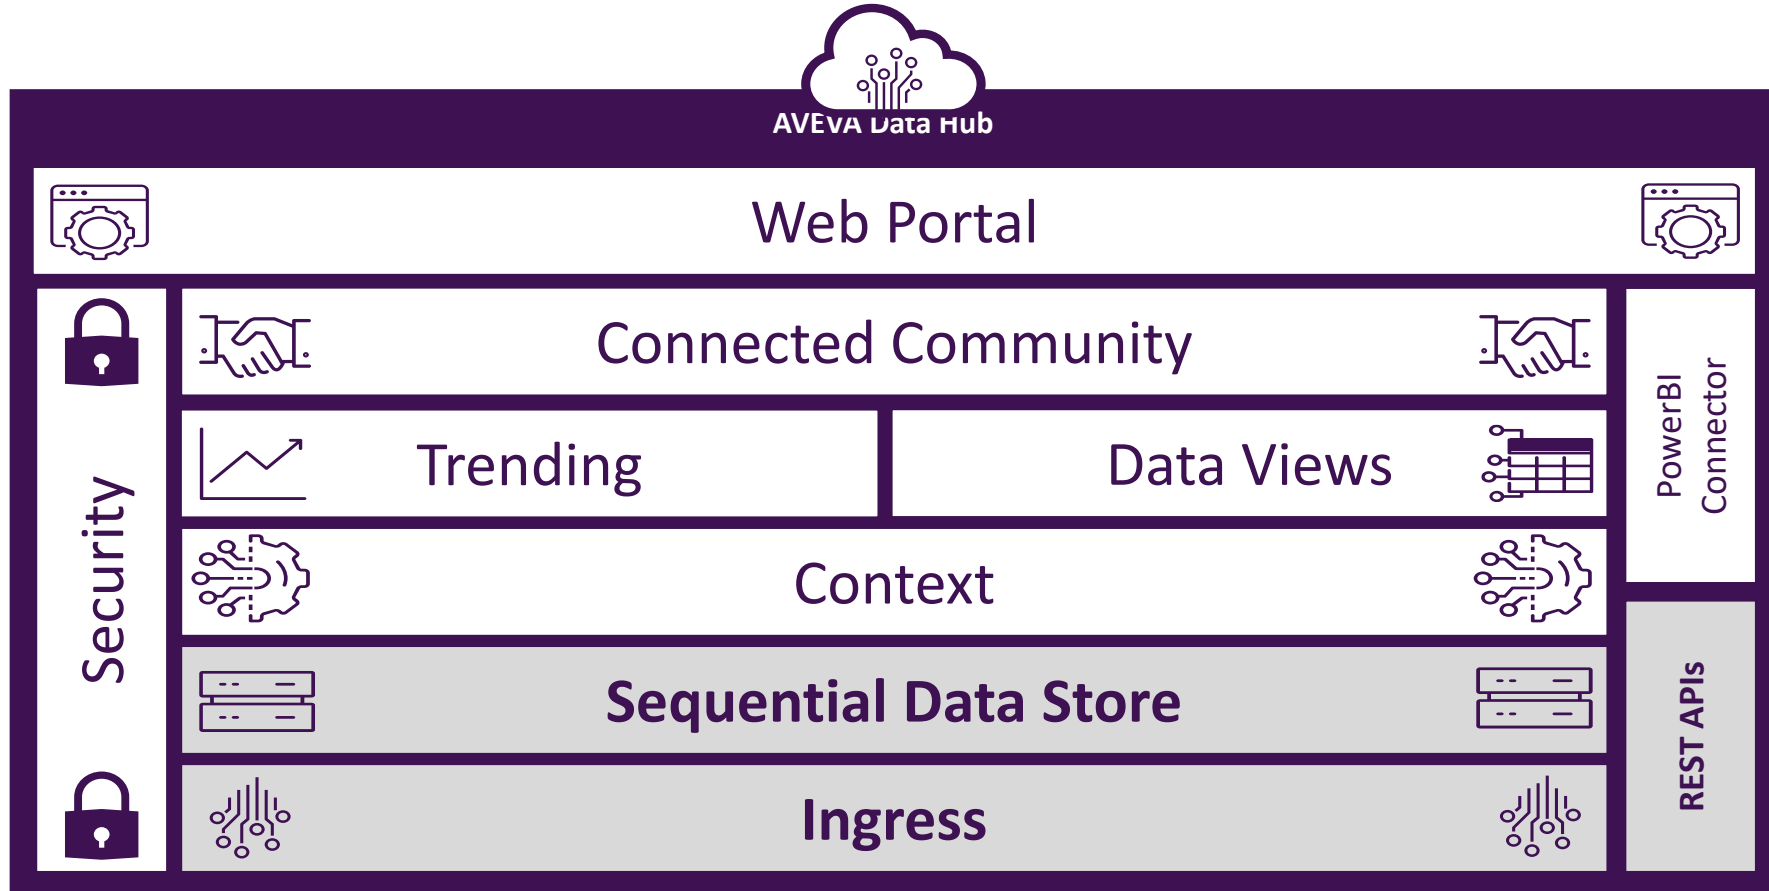

Complex vs Simple Types

Which should I choose?

- All types should have a value for each property on each event
 - If an event can and will occur without every property it should be broken apart or interpolation will not be valid
- Stream views can be used to view a type in a different way or to permanently retype a stream

Ingress and REST APIs

SDS API vs OMF

What is SDS API?

- Sequential Data Store
 - Purpose-built sequential data storage for AVEVA Data Hub and Edge Data Store
- Terminology
 - Types
 - Streams
 - Events
- Send multiple events to a stream

```
[  
  {  
    "Timestamp": "2023-07-17T21:12:08.1915788Z",  
    "Value": 0  
  },  
  {  
    "Timestamp": "2023-07-17T21:15:00.6197394Z",  
    "Value": 10  
  },  
  {  
    "Timestamp": "2023-07-17T21:20:00.7899553Z",  
    "Value": 30  
  }  
]
```

```
{
  "containerid": "Tank1_PressureMeasurements",
  "values": [{
    "Timestamp": "2019-09-11T22:23:23.430Z",
    "Pressure": 12.0
  }, {
    "Timestamp": "2019-09-11T22:24:23.430Z",
    "Pressure": 11.5
  }
], {
  "containerid": "Tank2_PressureMeasurements",
  "values": [{
    "Timestamp": "2019-09-11T22:23:23.430Z",
    "Pressure": 14.0
  }, {
    "Timestamp": "2019-09-11T22:24:23.430Z",
    "Pressure": 15.1
  }
]
}
```

SDS API vs OMF

What is OMF?

- Open Message Format
 - Generic format that can be interpreted by PI, ADH and EDS
- Terminology
 - Types
 - Containers
 - Data values
- Send multiple data values to multiple containers

SDS API vs OMF

Similarities and differences

- SDS
 - Single Stream
 - Immediate response/validation
 - EDS and ADH only
 - OMF
 - Multiple containers
 - Minimal validation
 - Can send to PI, EDS and ADH
-
- Simple and Complex stream definitions *
 - Non-time series and compound indices*

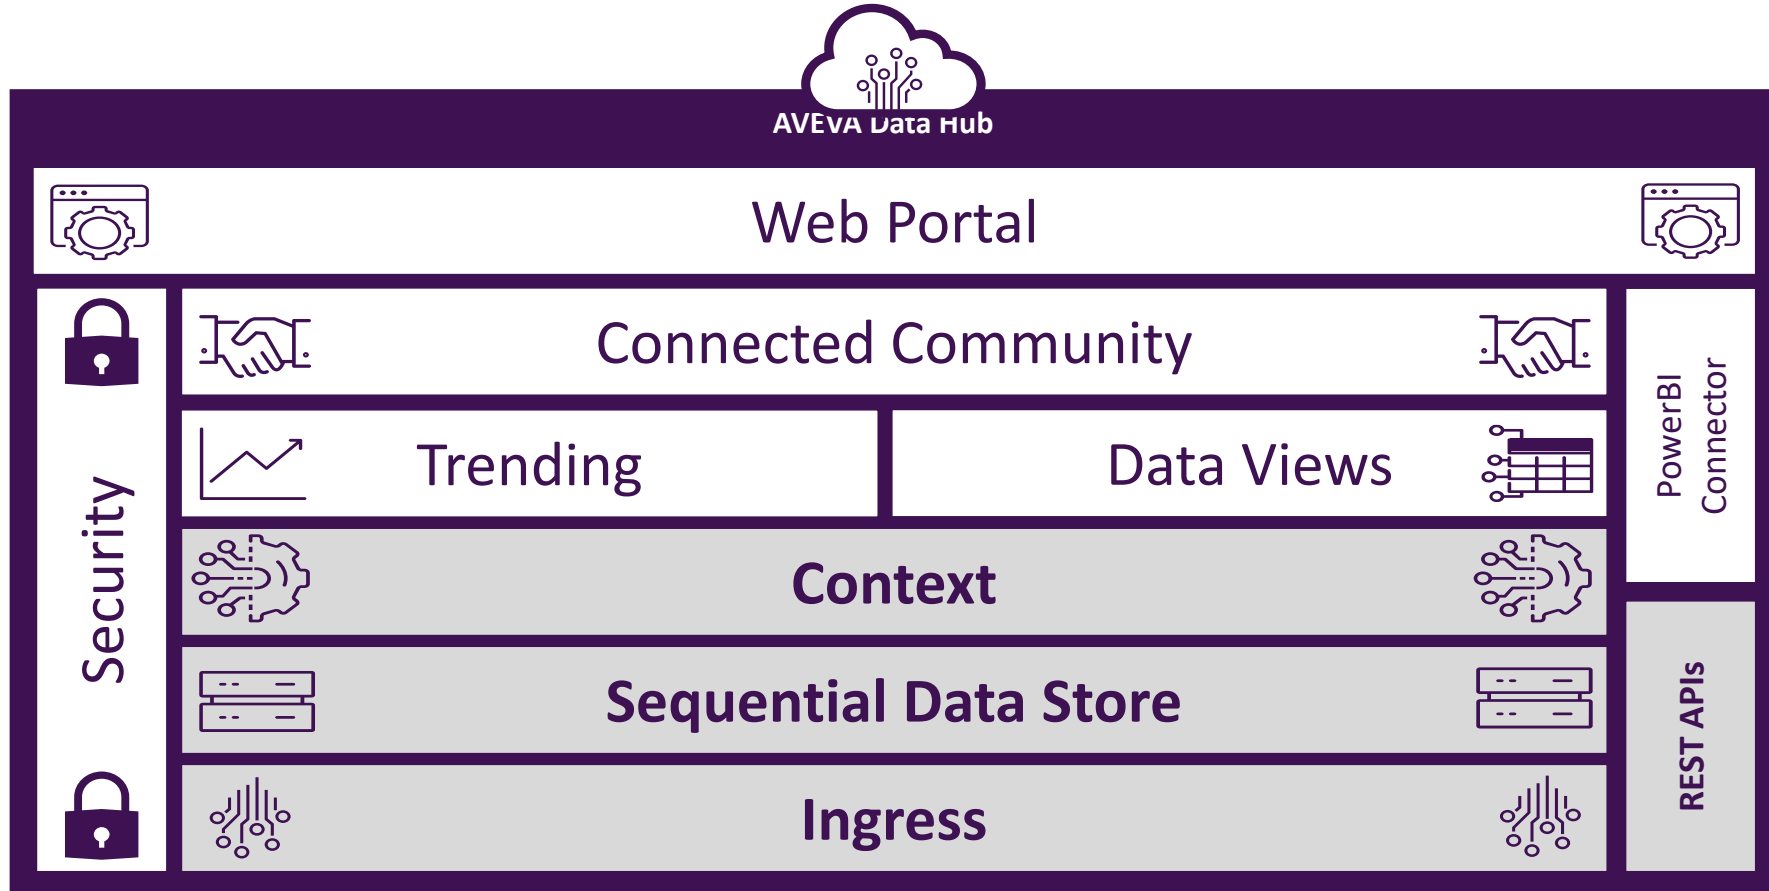

SDS API vs OMF

What data ingress do I choose?

- Adapter, PI Server, AVEVA Historian, AVEVA System Platform, Edge Data Store
- OMF for ingress applications
- SDS for situations where you are reading SDS data and writing it back into a few streams

Ingress and REST APIs

Data Ingestion Best Practices

- In-order data (increasing, for the stream)
- SDS Type reuse
- UOMs can be set on type and/or streams
- Naming patterns

Create Metadata from Stream name patterns with Metadata Rules

BAC.101313.Phase.PV

Details **Metadata and Tags** Sharing

Stream Tags

No tags to display.

Stream Metadata

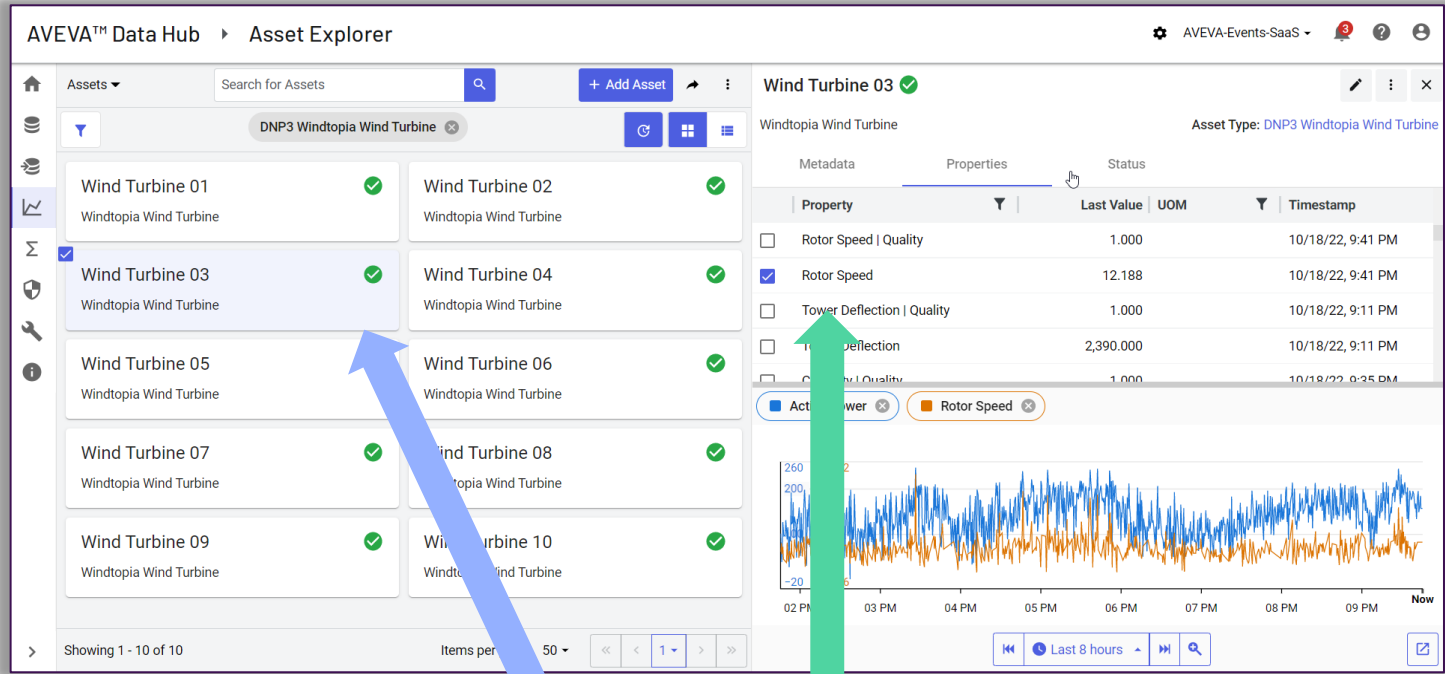

Metadata	Value	
Adapter	Bacnet	i
Equipment	101313	i
Measurement	Phase	i
ValueType	Present Value	i

Metadata RULES

BAC identifies the adapter name	101313 identifies the equipment number	Phase identifies the measurement	PV identifies the value
---	--	--	---------------------------------------

STREAM NAME **BAC.101313.Phase.PV**
BAC.101413.Phase.PV

Create Assets from Stream name patterns with Asset Rules

Asset RULES

WindTurbine03 identifies the asset name

RotorSpd identifies the Rotor Speed property

STREAM NAME

DNP3-1.WindTurbine03.RotorSpd.0

DNP3-1.WindTurbine03.RotorDeflection.0

DNP3-1.WindTurbine04.RotorSpd.0

Use Case – define problem

Ingressing data from particle sensors

- Small IoT devices running on Linux
- Multiple devices in multiple locations
- Need custom code to read the values, send to AVEVA Data Hub (Sequential Data Store) as streams
- Preference to develop in .NET Core

DEMO – Ingress

Steps

- Start with Github sample: https://github.com/AVEVA/sample-adh-omf_ingress-dotnet
 - Simplify by deleting OMF connection creation logic
 - Assume OMF connections and clients have been created
 - Delete logic to clean up OMF connections, SDS types and streams
- Replace Main() method as follows:
 - Read constants from appsettings.json to configure app
 - Send OMF type and container messages
 - Setup timer loops for collecting and sending data
 - Add sensor-specific code to collect the data and add to a queue
 - Send data from queue

AVEVA Samples

AVEVA is a proven leader in enabling operation intelligence. In this GitHub repo, we provide navigatoin to sample repos which will help you get started with using AVEVA technology. The samples are intended to help you get started and are not production applications and libraries.

The official AVEVA samples are organized by technology and accessible through the following table, note you can always utilize GitHub search to find a repo too:

View as: Public

You are viewing the README and pinned repositories as a public user.

How to best read data out?

What are streams?

- Fundamental block of SDS
 - An instantiated object of an SDS type
- Can have UOMs, interpolation, extrapolation defined on each property at the stream or type
- Metadata and tags
- Can be shared to a community
- Summary data calls
- Stream views
 - Remove or rename properties
 - Change UOM

The screenshot displays the AVEVA data management interface. On the left, a table lists various streams with columns for Name, Id, Description, and Type. The stream 'GE01_Q' is selected. On the right, the details for 'GE01_Q' are shown, including its Id, Name, Description, Type, Namespace, Stream URL, and Stream Properties. The Stream Properties are displayed as a JSON object.

Name	Id	Description	Type
GE01_LL3	PI_dfpiserverprd.osisoft.ext_267...	Turbine 01 Current L3-OC...	PI-Float32

```

How to best read data out?

What are assets?

- Fundamental block in ADH
 - Can be based on an asset type
- Collection of streams
 - Can read just some properties(streams)
- Metadata
- Asset status

The screenshot displays a web-based interface for asset management. On the left, a list of assets (GE01 to GE10) is shown, with GE01 selected. The right pane provides a detailed view for asset GE01, including a table of properties and a time-series chart for Active Power (kW).

Asset List:

Asset ID	Asset ID
GE01	GE02
GE03	GE04
GE05	GE06
GE07	GE08
GE09	GE10

Asset GE01 Properties Table:

Property	Last Value	UOM	Timestamp
<input checked="" type="checkbox"/> Active Power	1,524.771	kW	18/09/2023, 14:17
<input type="checkbox"/> Active Power - 10 min rolling avg	-1.003	kW	18/09/2023, 14:29
<input type="checkbox"/> Apparent Power	1,526.101	kW	18/09/2023, 14:18
<input type="checkbox"/> Apparent Power - 10 min rolling a...	1.003	kW	18/09/2023, 14:29
<input type="checkbox"/> Auto Stop Aggregation_Revenue...	-0.002		16/09/2023, 02:49
<input type="checkbox"/> Auto Stop Flag	0		18/09/2023, 10:51
<input type="checkbox"/> Auto Stop Reason	4.000		18/09/2023, 07:28
<input type="checkbox"/> Availability Flag	1.000		18/09/2023, 07:24

Active Power (kW) Chart:

The chart shows Active Power (kW) over the last 8 hours. The y-axis ranges from 0 to 1,800 kW. The x-axis shows time from 08 AM to 03 PM. The power starts at approximately 500 kW at 08 AM, rises to about 1,500 kW by 10 AM, and then fluctuates between 1,000 kW and 1,500 kW until 03 PM. A dashed horizontal line is drawn at approximately 1,500 kW.

How to best read data out?

What are data views?

- Based on a query against assets or streams
 - Can query other namespaces and communities
- Pre-defined (time range is variable)
- Re-name columns
- Summary values
- Different output forms
 - JSON
 - CSV
 - Table
 - Parquet

The screenshot displays the AVEVA data view interface for 'Windtopia Assets'. The view is titled 'Description' and is set to 'Standard' shape. It features a 'Filter Fields...' section with an 'Add' button. The main data table has columns for 'Timestamp', 'Bearing B Temperature Value °C', 'Blade1, Actual Value Value °', 'Blade1, Set Value Value °', and 'Blade2, ...'. The data shows hourly readings for September 17, 2023. The interface also includes a 'Query1' section with 'Identifying Field' and 'IdentifyingValue' options, and a 'Manage Queries' button in the top right corner.

Timestamp	Bearing B Temperature Value °C	Blade1, Actual Value Value °	Blade1, Set Value Value °	Blade2, ...
17 Sept 2023, 00:00:00	72.18041	1.6071825	1.1673927	1.57285
17 Sept 2023, 01:00:00	75.166084	10.608109	10.885652	10.3758

How to best read data out?

Things to consider

- Repeated pre-defined query vs ad-hoc investigation
- Interpolated vs stored (note all support both...)
- Tabular data?
- Default value
- Separating query into smaller ranges on different threads
- Paging
- UOMs
- Summary Calculations

DEMO Use Case

Wind farm operator

- Operating fleet of wind turbines
- Need one year's worth of 5 second data for 10 assets with ~50 streams each
- Need to make the data available for machine learning project
=> would like the data in a centralized data lakehouse in **Microsoft Fabric** to perform ML analytics at scale
- Use Data Views in AVEVA Data Hub to transform data from assets to a more structured tabular form, and determine the API and query parameters to egress in Apache Parquet format
- Use Data Pipelines to ingest this data as efficiently as possible into Fabric using pagination and parallelization
- AVEVA collaborated with Microsoft in designing such a pipeline

Latest Service Updates

PI to Data Hub 2.2 is released

Jul 17, 2023, 2:33:09 PM

AVEVA is pleased to announce a new release for PI to AVEVA Data Hub. With this release, PI to Data Hub now enables usage reporting for AVEVA PI Data Infrastructure – aggregate tag licensing model. This licensing option allows customers to purchase PI Tags in aggregate (with a minimum committed number of tags) across any number of deployed PI Servers rather than having to specify a fixed number of PI Tags for a specific PI Data Archive server.

New! AVEVA PI Data Infrastructure – aggregate tag support

Microsoft Fabric

All your data. In one location. Organize. Collaborate. Create.

Explore the experience

Power BI
Find insights, track progress, and make decisions faster using rich visualizations.

Data Factory
Solve the most complex data integration and ETL scenarios with cloud-scale data movement and data transformation services.

Data Activator
Monitor data to trigger alerts and automated actions so your organization adapts to changing conditions in real time.

Synapse Data Engineering
Create a lakehouse, and use Apache Spark to transform and prepare organizational data to share with the business.

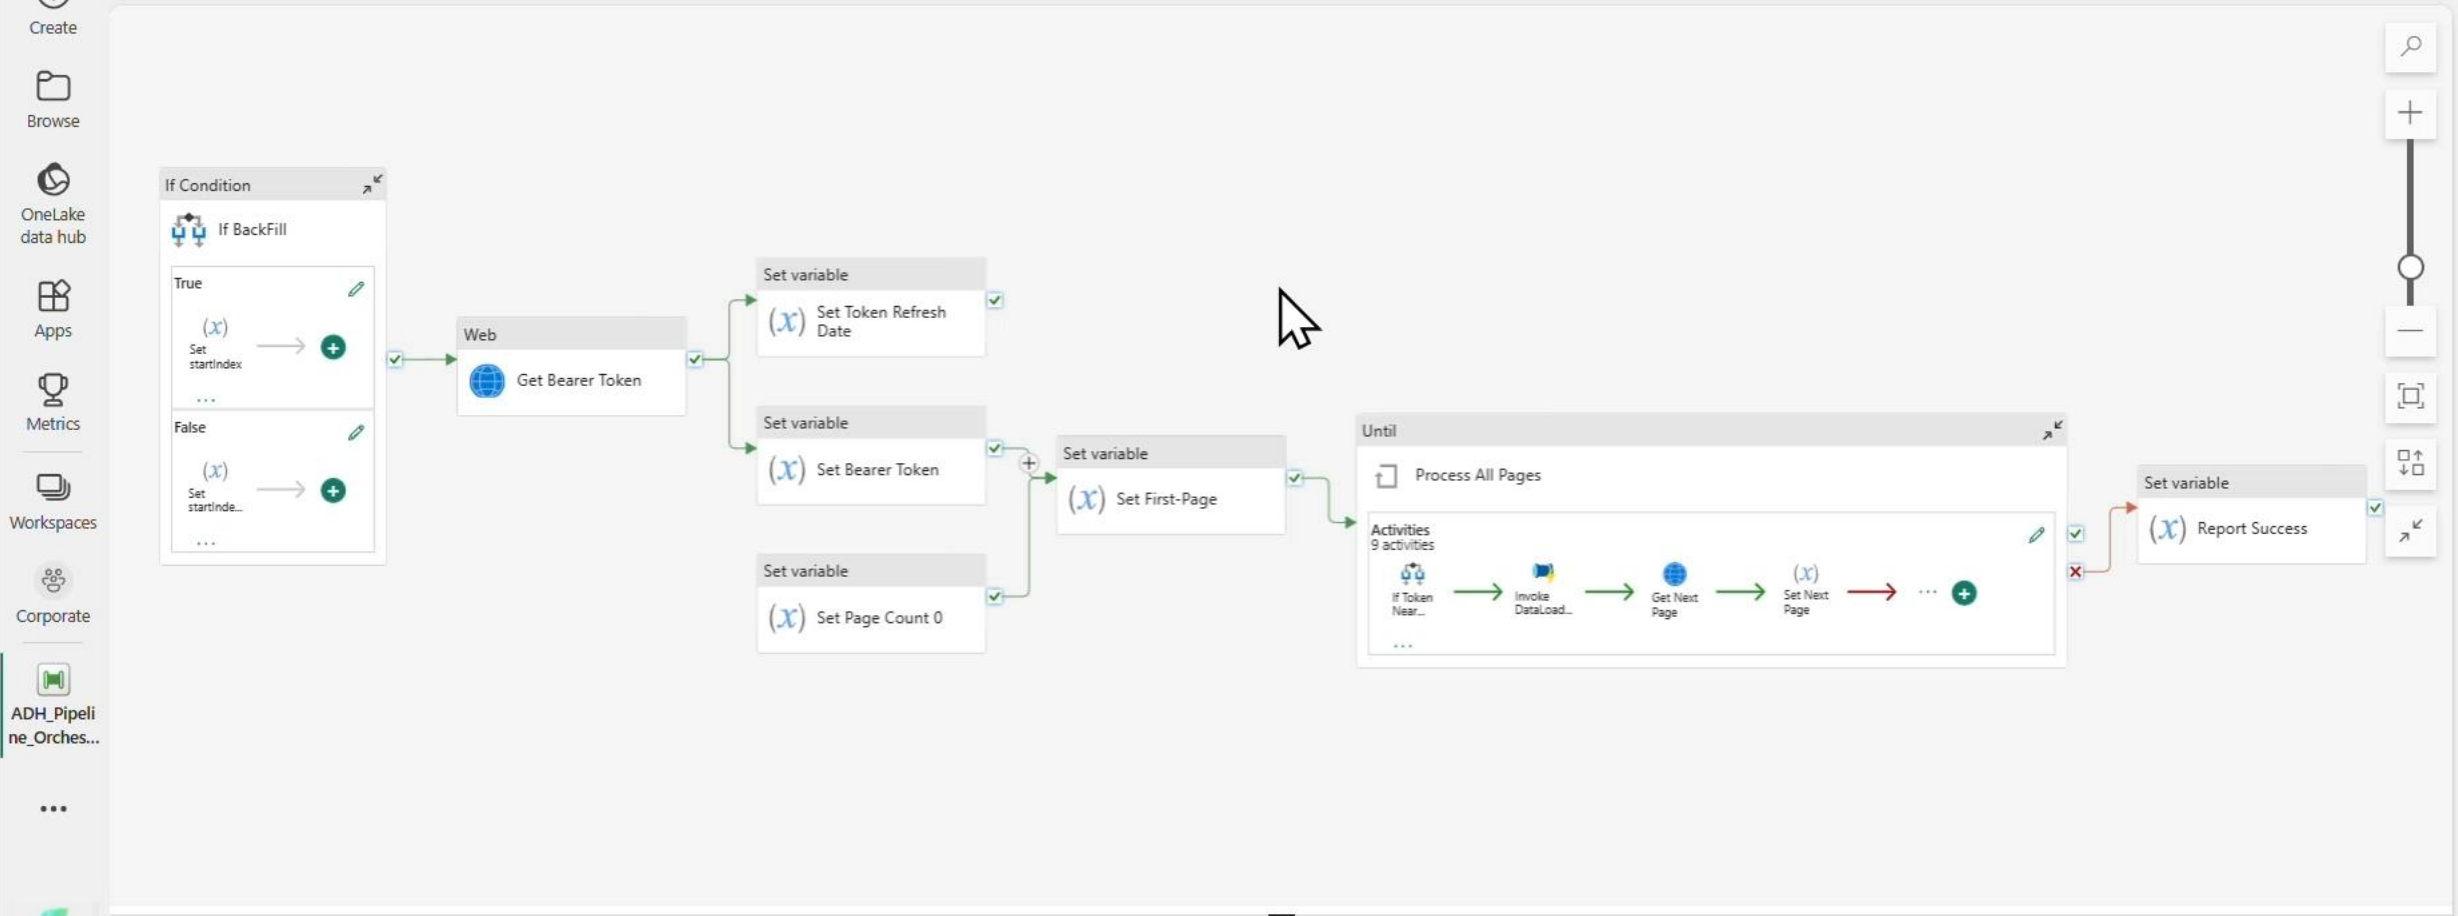

Synapse Data Science
Explore your data, and build machine learning models to infuse predictive insights into your analytics solutions and applications.

Synapse Data Warehouse
Scale up your insights by storing and analyzing data in a secure, open-data-format SQL warehouse with top performance at PB scale.

Synapse Real-Time Analytics
Rapidly ingest, transform, and query any data source and format, from 1 GB to 1 PB, and then visualize and share the insights.

ABOUT AVEVA

AVEVA is a world leader in industrial software, providing engineering and operational solutions across multiple industries, including oil and gas, chemical, pharmaceutical, power and utilities, marine, renewables, and food and beverage. Our agnostic and open architecture helps organizations design, build, operate, maintain and optimize the complete lifecycle of complex industrial assets, from production plants and offshore platforms to manufactured consumer goods.

Over 20,000 enterprises in over 100 countries rely on AVEVA to help them deliver life's essentials: safe and reliable energy, food, medicines, infrastructure and more. By connecting people with trusted information and AI-enriched insights, AVEVA enables teams to engineer efficiently and optimize operations, driving growth and sustainability.

Named as one of the world's most innovative companies, AVEVA supports customers with open solutions and the expertise of more than 6,400 employees, 5,000 partners and 5,700 certified developers. The company is headquartered in Cambridge, UK.
