

OCTOBER 25, 2023

Expanding the value of AVEVA™ PI System™ with online process simulation & predictive analytics

Unlocking additional value from your operations data through predictive asset optimization

Andrew Nathan – Senior Principal Solution Consultant - AVEVA

Ryan Muir – Global Principal Architect - AVEVA

The AVEVA logo is displayed in white, bold, uppercase letters. The letter 'A' is stylized with a horizontal bar that extends to the left and then turns down to form the left vertical stroke.

Agenda

- AVEVA PI System as operational data infrastructure
- AVEVA PI System with process simulation
- AVEVA PI System with predictive analytics
- Predictive Asset Optimization (PAO)
- Customer success story
- How AVEVA accelerates data potential journey
- Call to action

THE MODERN PI SYSTEM

AVEVA™ PI System™ as operational data infrastructure

AVEVA

AVEVA™ PI System™

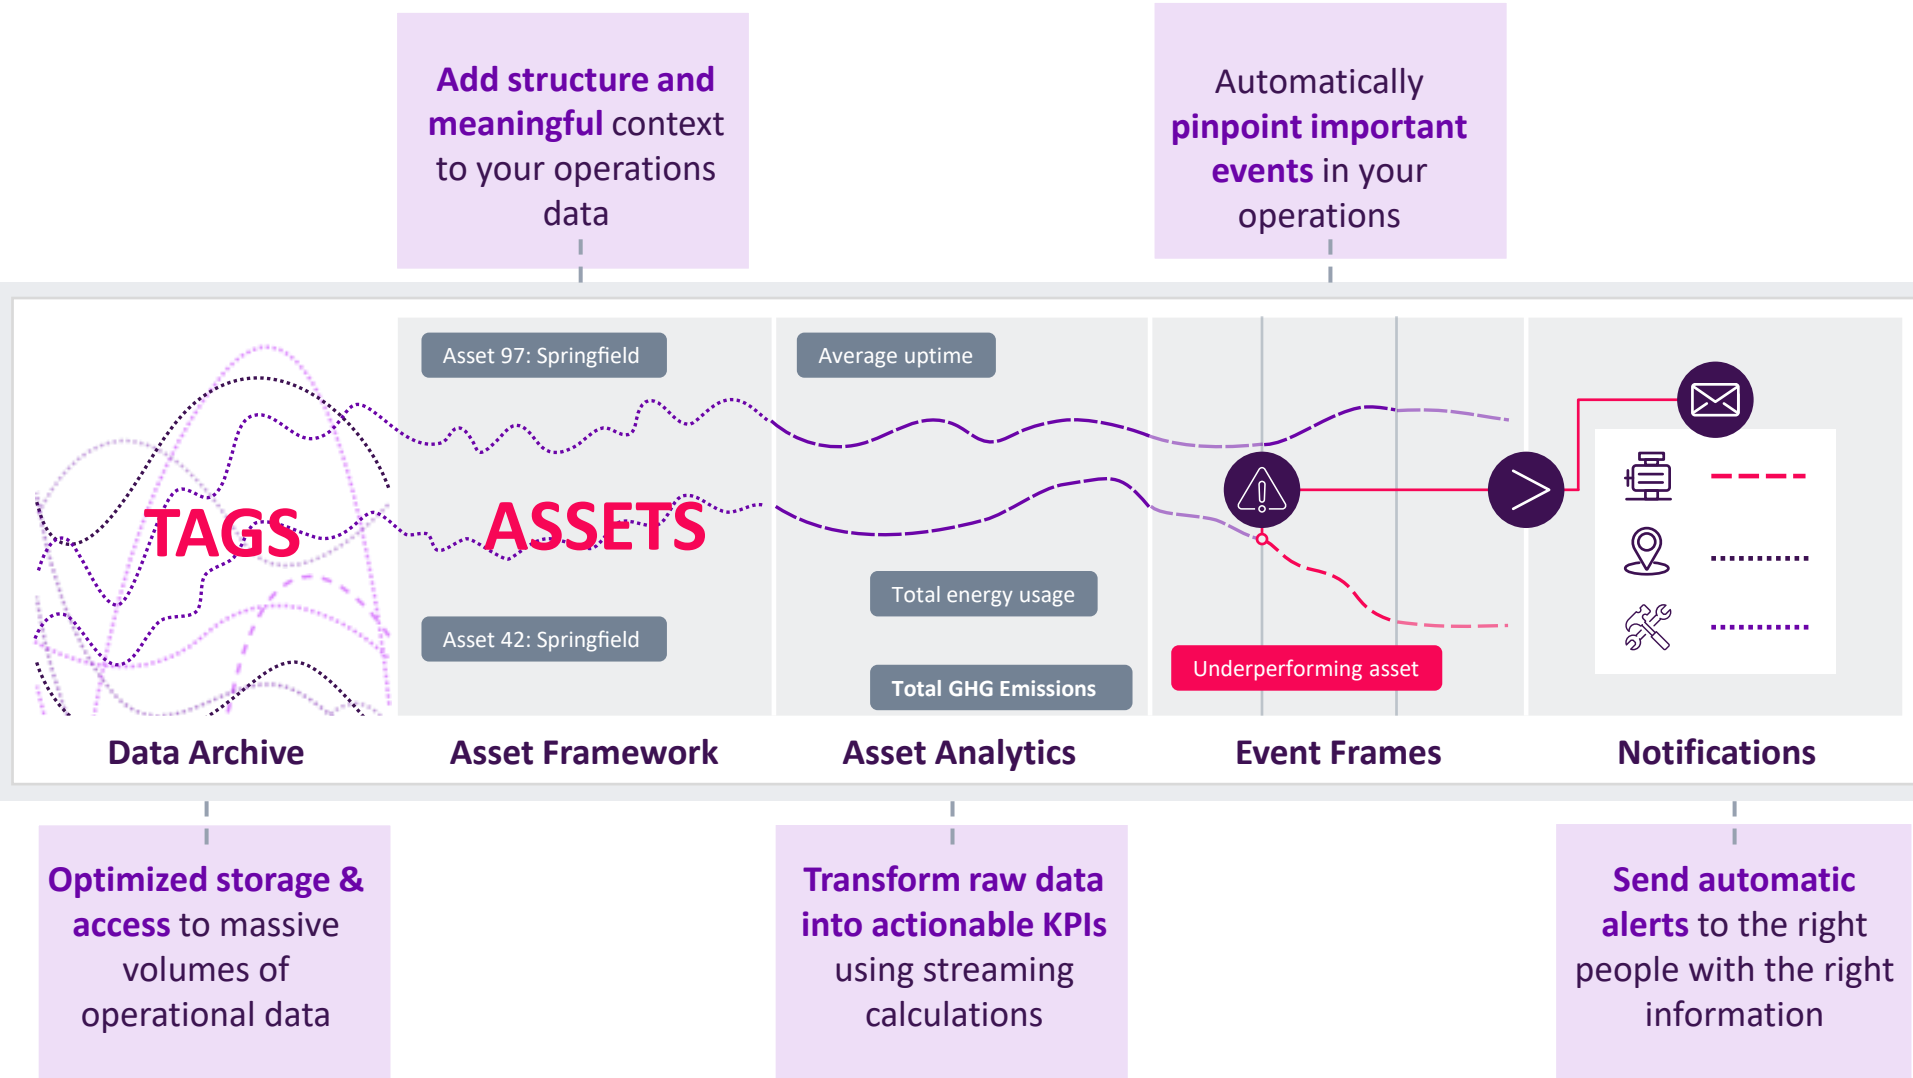

Industrial data backbone for digital transformation

INDUSTRIAL DATA INFRASTRUCTURE BACKBONE

Turning data into decision-ready information

How can you keep expanding your data potential?

Turning data into decision-ready information

Data Archive
Optimized storage & access to massive volumes of operational data

Asset Framework
Add structure and meaningful context to your operations data

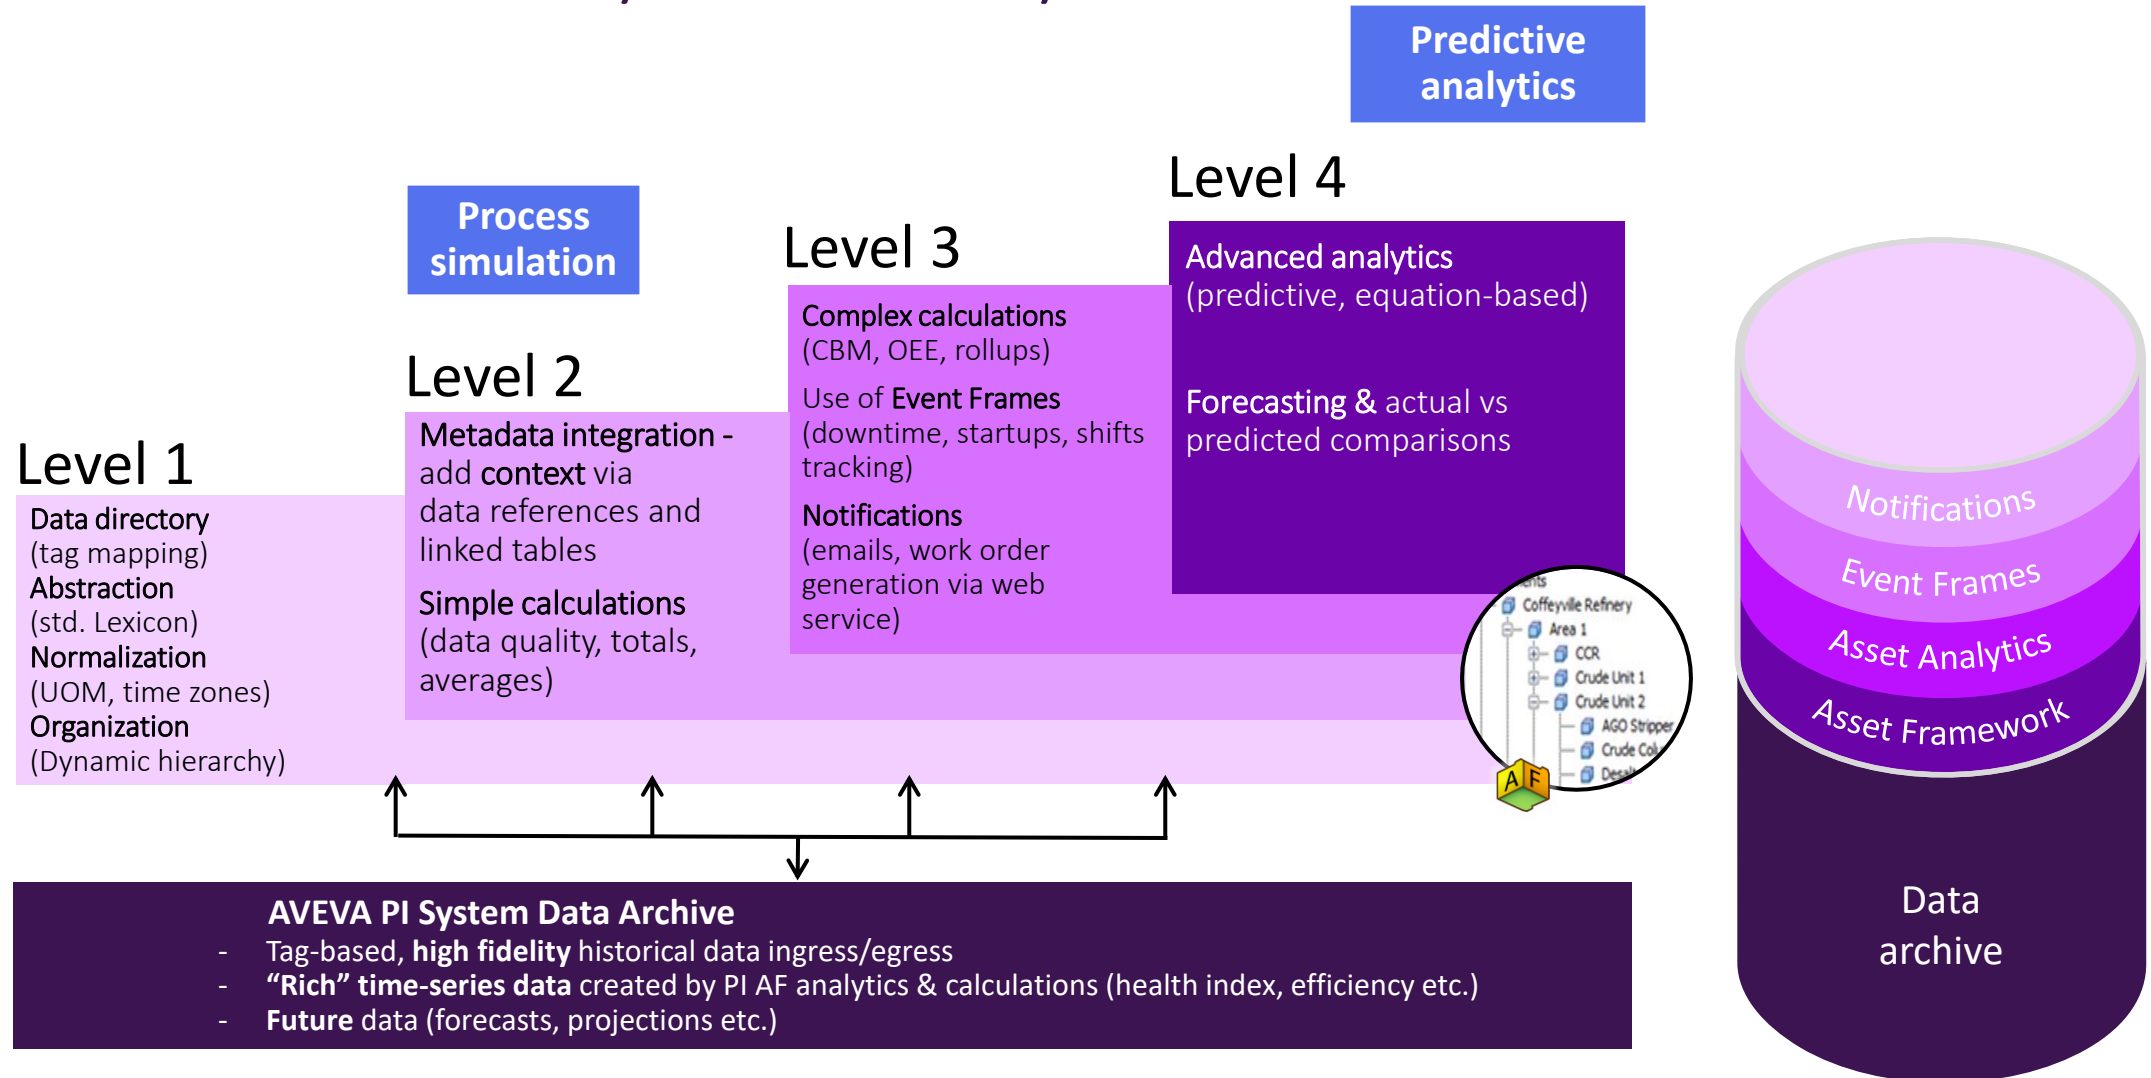

Asset Analytics
Transform raw data into actionable KPIs using streaming calculations

Event Frames
Automatically pinpoint important events in your operations

Notifications
Send automatic alerts to the right people with the right information

Expand the data potential with additional capabilities	
Cloud-based collaboration	Advanced visualization
AI and ML models	Immersive environments
Risk assessment tools	Optimization models
Automated procedures	Mobile operator tools
Execution management	Digital twins

Integration readiness by PI maturity levels

How to get new value from integration of your data infrastructure with process simulation?

AVEVA

Process Simulation 101

Model-based representation of simultaneous chemical, physical, hydraulic & other technical processes

Unit operations & equipment

- Distillation
- Reactor
- Vessel
- Pump
- Heat exchanger
- Compressors

$$\eta_c = \left[\left(\frac{p_2}{p_1} \right)^{(\gamma-1)/\gamma} - 1 \right] / \left[\left(\frac{p_2}{p_1} \right)^{(\gamma-1)/\eta_p \gamma} - 1 \right]$$

Thermodynamic models

UNIFAC (Original):

$$\ln(\gamma_j) = \ln(\gamma_{j,c}) + \sum_{i=1}^N n_{ji} \{ \ln(\gamma_i) - \ln(\gamma_{ji}) \} \text{ where}$$

$$\ln(\gamma_{j,c}) = \ln(\Phi_j / x_j) + 5q_j \ln(\Theta_j / \Phi_j) + l_j - \Phi_j / x_j \sum_{k=1}^3 x_k l_k$$

$$\Theta_i = x_i q_i / \sum_{j=1}^3 x_j q_j ; \Phi_i = x_i r_i / \sum_{j=1}^3 x_j r_j ; l_j = 5(r_j - q_j) + 1 - r_j$$

$$\gamma_{j,k} = Q_{type(k)} \cdot \left[1 - \sum_{i=1}^N \theta_{j,i} \cdot \psi_{ki} - \sum_{m=1}^N \theta_{j,m} \cdot \psi_{mi} - \ln \sum_{i=1}^N \theta_{j,i} \cdot \psi_{ki} \right]$$

$$\gamma_k = Q_{type(k)} \cdot \left[1 - \sum_{i=1}^N \theta_{M,i} \cdot \psi_{ki} - \sum_{m=1}^N \theta_{M,m} \cdot \psi_{mi} - \ln \sum_{i=1}^N \theta_{M,i} \cdot \psi_{ki} \right]$$

$$x_{j,i} = n_{j,i} / \sum_{m=1}^N n_{m,i} ; \theta_{j,i} = x_{j,i} \cdot Q_{type(i)} / \sum_{i=1}^N x_{j,i} \cdot Q_{type(i)}$$

$$x_{M,i} = \sum_{m=1}^3 x_m n_{m,i} / \sum_{k=1}^3 \sum_{m=1}^N x_m n_{m,k} ; \theta_{M,i} = x_{M,i} \cdot Q_{type(i)} / \sum_{i=1}^N x_{M,i} \cdot Q_{type(i)}$$

VLLE
Van der Waals
Soave Redlich-Kwong
Peng-Robinson

$$PV = nRT$$

Steady state & dynamic

$$u(t) = K_P e(t) + K_I \int e(t) dt + K_D \frac{de(t)}{dt}$$

First principles model

$$k = A \cdot e^{-E_a/RT}$$

Process Simulation 101

Delivering the process digital twin with a first principles platform

The screenshot displays the AVEVA Process Simulation software interface for a 'CC2 Example - Economics and Sustainability' project. The main window shows a process flow diagram with various units and streams. Key summary data is provided in two tables:

SummaryEcon	
SummaryEcon.TotalUtilityCost	1458.25 \$/h
SummaryEcon.TotalRawMatCost	10598.3 \$/h
SummaryEcon.TotalProductValue	16286.1 \$/h
SummaryEcon.TotalOperatingCost	-3968.86 \$/h
SummaryEcon.TotalCapInvestment	5.40142 M\$

SummaryGHG	
SummaryGHG.GWP	720308 g/tons
SummaryGHG.Efactor	0.102792
SummaryGHG.CE	0.908218 fraction
SummaryGHG.TotalCO2e	10428.4 kg/h

The process flow diagram includes streams for BENZENE (20823.5 lb/h), PROPENE (11108.3 lb/h), and various control elements like FT2, FC2, FRC, FC1, FV2, FV1, MX2, and MX1. A configuration window for 'BENZENE (Process.Source)' shows parameters such as W (20823.5 lb/h), F (120.919 kmol/h), Q (0.106296 ft3/s), P (35 bar), T (86 F), VF (-0.927779 mol frac), M (231.486 lbmol), z (78.1136 lb/lbmol), and MW (78.1136 lb/lbmol).

A 'Profile1' window displays a 'Reactor Temperature Profile' graph showing Temperature (F) on the y-axis (ranging from 657 to 767) versus an unlabeled x-axis (ranging from 1 to 20). The graph shows a bell-shaped curve peaking at approximately 755 F.

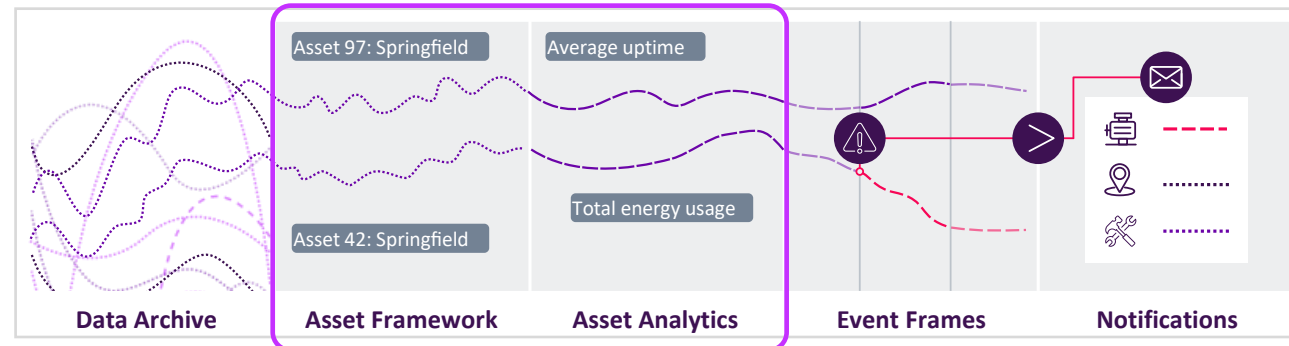

At the bottom, a table lists 'Equations' for the simulation:

Condition	Name	Status	Formula	Start	End	Description
	k ₁	●	$k_1 = 35000 \cdot \exp(-24901 / (1.987 \cdot T))$			Activation energy for 1st reaction in [kcal/kmol], Gas Constant R=1.987 kcal/km
	k ₂	●	$k_2 = 2900000 \cdot \exp(-35080 / (1.987 \cdot T))$			Activation energy for 2nd reaction in [kcal/kmol], Gas Constant R=1.987 kcal/km
	r ₁	●	$r_1 = k_1 \cdot C \cdot z["PROPENE"] \cdot C \cdot z["BENZENE"]$			Reaction rate for 1st reaction in [kmol/kg-cat/sec]
	r ₂	●	$r_2 = k_2 \cdot C \cdot z["PROPENE"] \cdot C \cdot z["CUMENE"]$			Reaction rate for 2nd reaction in [kmol/kg-cat/sec]
	Rate_Propene	●	$\text{Rate}["PROPENE"] = -r_1 - r_2$			
	Rate_Benzene	●	$\text{Rate}["BENZENE"] = -r_1$			
	Rate_Cumene	●	$\text{Rate}["CUMENE"] = r_1 - r_2$			

The case for AVEVA™ PI System™ and process simulation

Real-time data + asset analytics

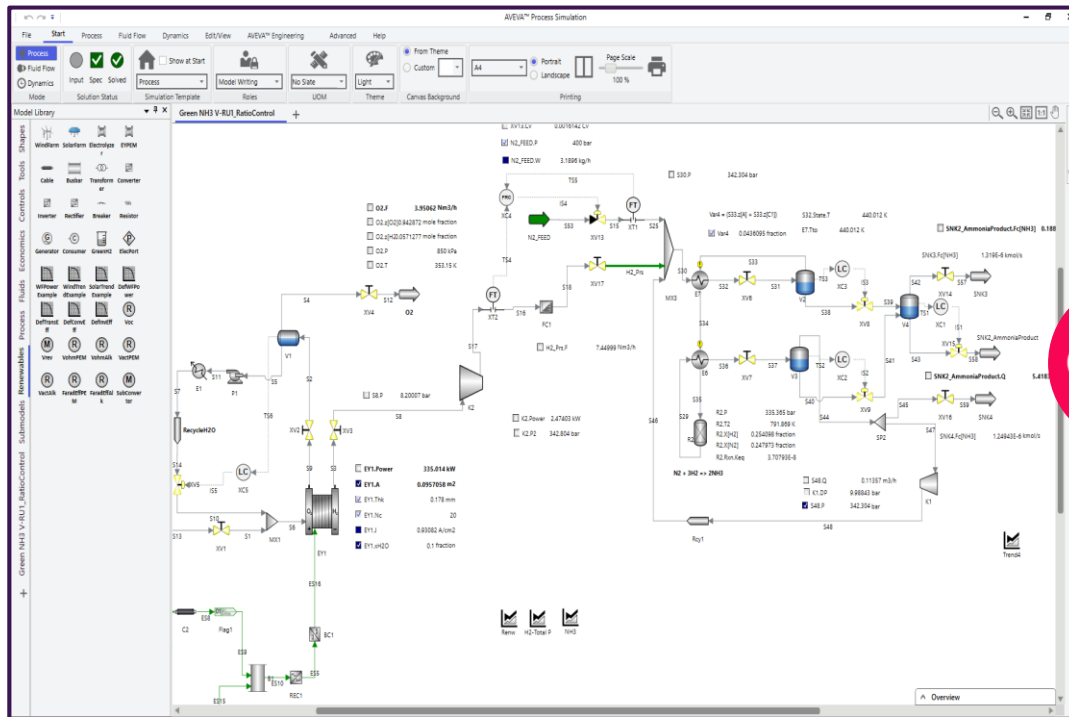

- ✓ Create asset templates to calculate and monitor simple KPIs for equipment
- ✓ Easily scale and deploy asset templates across your enterprise
- ✗ No insight beyond measured mechanical and process data
- ✗ Difficult to quantify asset impact on upstream & downstream processes

AVEVA™ PI System™ integration with process simulation

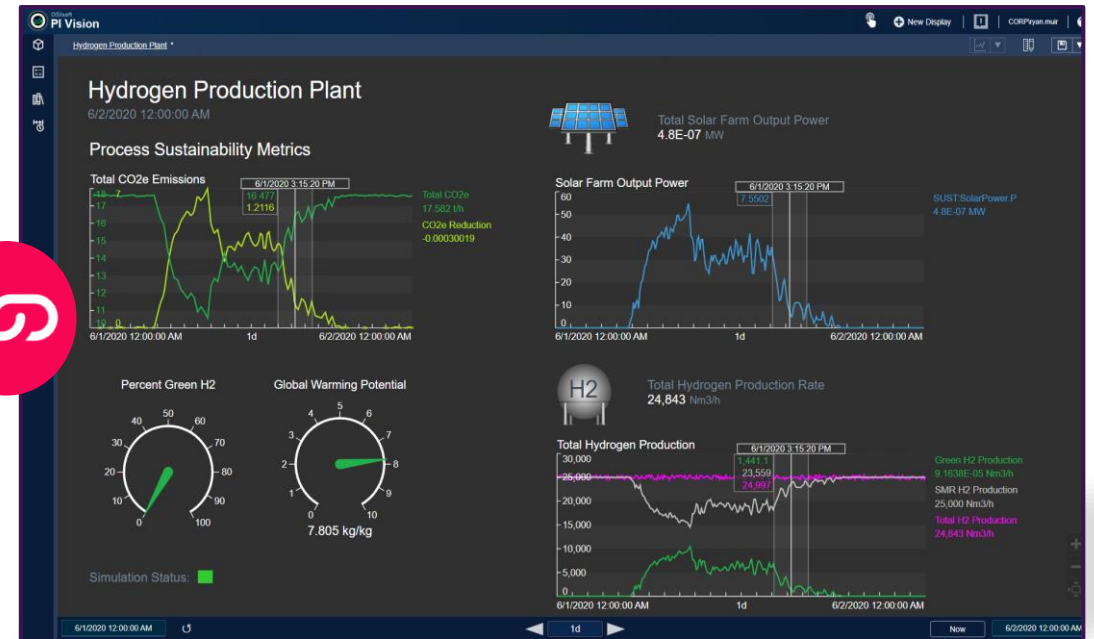

Deploy models online for real-time optimization and performance monitoring

Process simulation

First principles physics, chemical & hydraulic models

Live / archived process data

Operating digital twin

- Troubleshoot past & real-time operations
- Provide soft sensors
- Improve operation & efficiency
- Testing platform

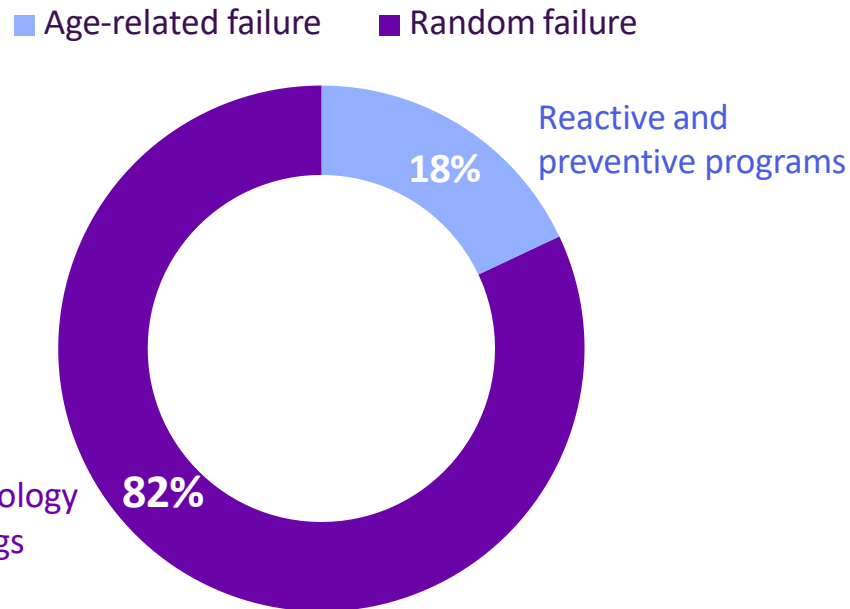

How to get new value from integration of your data infrastructure with predictive analytics?

AVEVA

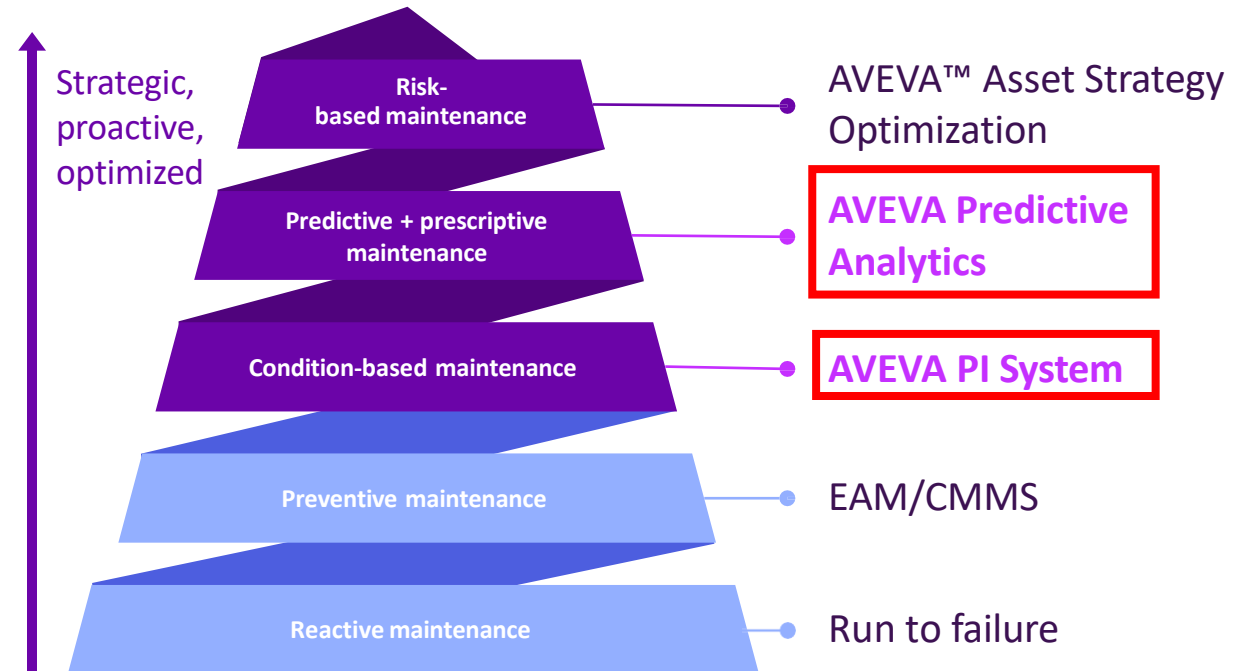

Optimize your asset reliability, maintenance and performance

A journey in operational reliability with AVEVA PI System and AVEVA Predictive Analytics

Failure patterns

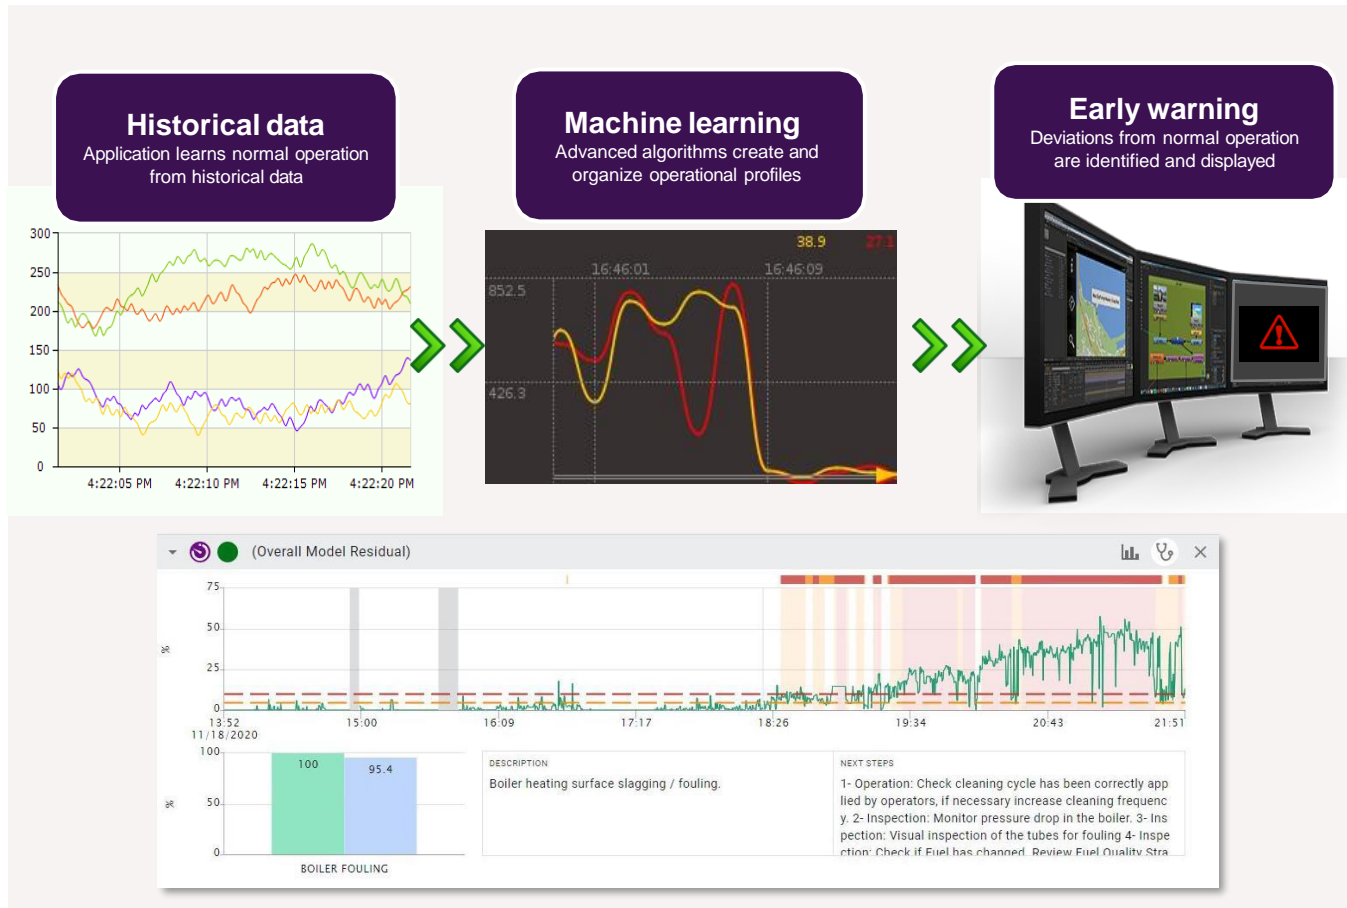

It's a journey

▲ARC studies show only 18% of asset failure is age-related. Based on these data, preventive maintenance provides a benefit for just 18 percent of assets, and monitoring for predictive maintenance is a recommended option for the rest.
www.Arcweb.Com/lists/posts/post.aspx?id=260

Monitoring with predictive analytics

The approach

The advantage

- Machine learning continuously monitors behavior in real time 24/7
- Alerts when operation differs from historical norm
- Early warning detection of equipment problems
- Advanced analysis capabilities including problem identification & root cause analysis

Automated model building

Deployment at scale for fast time to value

- PI Asset Framework templates integrate with AVEVA Predictive Analytics templates
- Minimize manual work with template integration
- Automatically include filters, alert thresholds, and fault diagnostics
- Automatic cleansing of training data

Minimize errors
Ensure consistency
Improve productivity

Automated model building

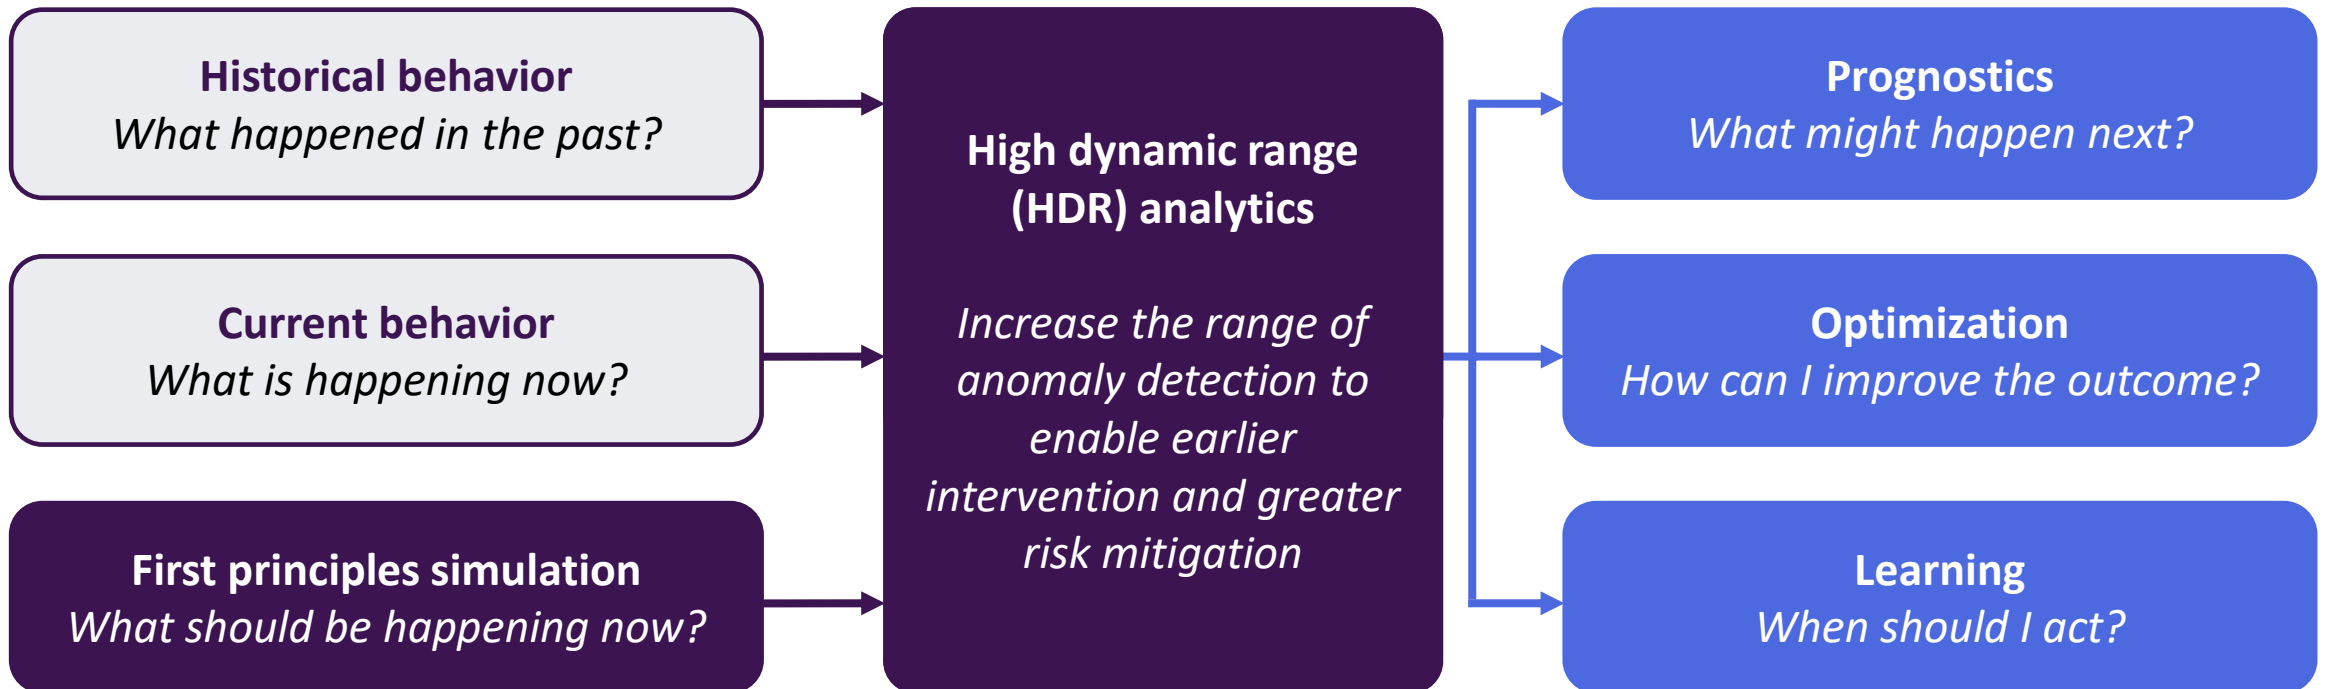

How to get additional value from integration of data infrastructure with BOTH process simulation & predictive analytics?

A: Predictive asset optimization (PAO)

AVEVA

What is predictive asset optimization (PAO)?

What is PAO? Real-time data + artificial intelligence + simulation + optimization

The case for AVEVA™ PI System™ and predictive analytics

Real-time data + predictive analytics

AI and condition-based multivariate analysis of process deviations

Early warning notifications, time-to-failure, and remaining useful life estimates

No insight beyond measured mechanical and process data

Difficult to quantify asset impact on upstream & downstream processes

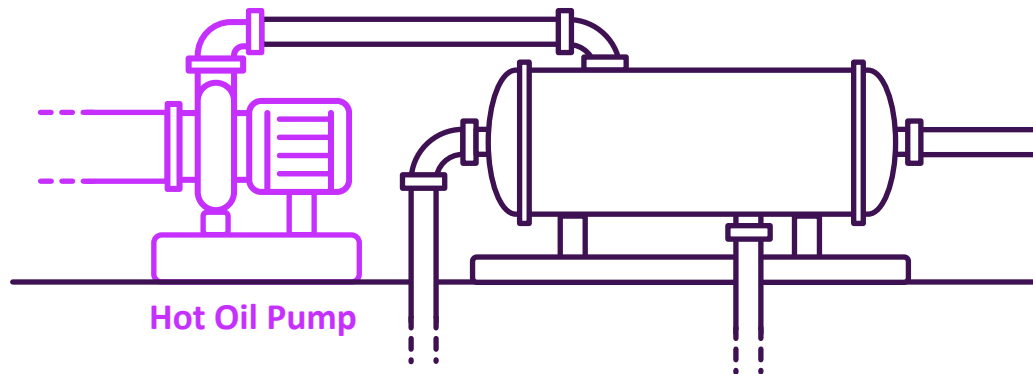

Hot Oil Pump

The case for AVEVA™ PI System™, predictive analytics, and process simulation

Real-time data + predictive analytics + simulation

- ✓ Quantify the impact of a single deviation on upstream & downstream assets
- ✓ Leverage rigorous equipment models for advanced KPI calculations
- ✓ Simplify deployment with easy drag-and-drop model building
- ✓ Test recommended actions in the digital twin before rollout

Scalability of predictive asset optimization

Customer success story

How Saudi Aramco is using PAO to improve their operations

AVEVA

Please join Aramco's AWC Presentation on Wed, Oct 25 from 11:40-12:10 in Oil, Gas & Energy Track

Challenge

- How to manage & improve asset reliability & major equipment performance across dozens of distributed sites?
- How to predict asset failure in advance to optimize resource planning & maintenance schedules?

Solution

- AVEVA™ Process Simulation (APS) and AVEVA Predictive Analytics connected to AVEVA PI System

Results

- Applied process simulation (APS) for real-time performance monitoring
- Online fault monitoring (OFM) solution being scaled & deployed
- OFM solution provides asset failure prediction & operational support for critical assets
- Reduced maintenance costs and improved asset reliability, availability & performance

“ We have used technology as an enabler to be more responsive, more adaptive, and more intelligent. ”

Abdulaziz Alzahrany – IT System Analyst, Aramco

Call to action

AVEVA

Call to action

Step 1

Identify a test case

Consider relevant use cases & identify one use case. Consider equipment with high criticality or problems

Outcome

Mutual understanding of model to build & evaluate

Step 2

Build and deploy model

During AVEVA PI Digital Twin Workshop, define success criteria & work together to develop & deploy initial integrated model

Outcome

Model built with AVEVA support & success criteria understood

Step 3

Confirm value

Evaluate model against defined success criteria to confirm value of solution

Outcome

Potential value identified & agreed upon. Model utilized as example for future rollouts

Q&A

ABOUT AVEVA

AVEVA is a world leader in industrial software, providing engineering and operational solutions across multiple industries, including oil and gas, chemical, pharmaceutical, power and utilities, marine, renewables, and food and beverage. Our agnostic and open architecture helps organizations design, build, operate, maintain and optimize the complete lifecycle of complex industrial assets, from production plants and offshore platforms to manufactured consumer goods.

Over 20,000 enterprises in over 100 countries rely on AVEVA to help them deliver life's essentials: safe and reliable energy, food, medicines, infrastructure and more. By connecting people with trusted information and AI-enriched insights, AVEVA enables teams to engineer efficiently and optimize operations, driving growth and sustainability.

Named as one of the world's most innovative companies, AVEVA supports customers with open solutions and the expertise of more than 6,400 employees, 5,000 partners and 5,700 certified developers. The company is headquartered in Cambridge, UK.
